Mocking Heaven Motivation

- Future surveys will cover extremely large volumes of the universe. eg. Euclid, LSST, CHIME, etc...
 - clustering measurements require an estimate of their covariance matrix for reliable cosmological constraints
- Determine impact of various systematic effects
- Pipeline Analysis

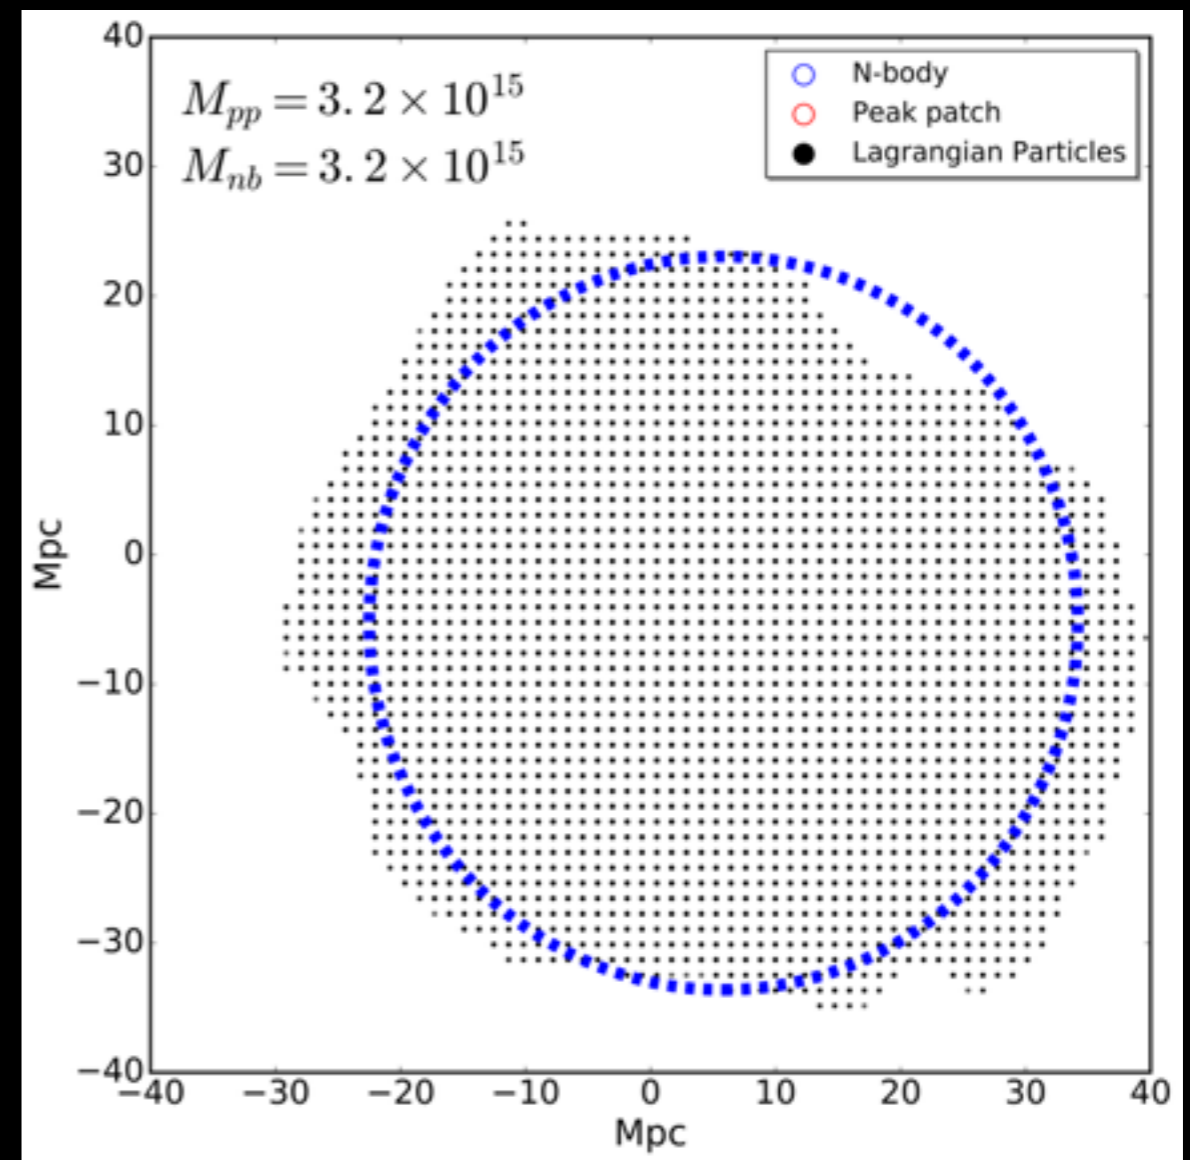

N-body

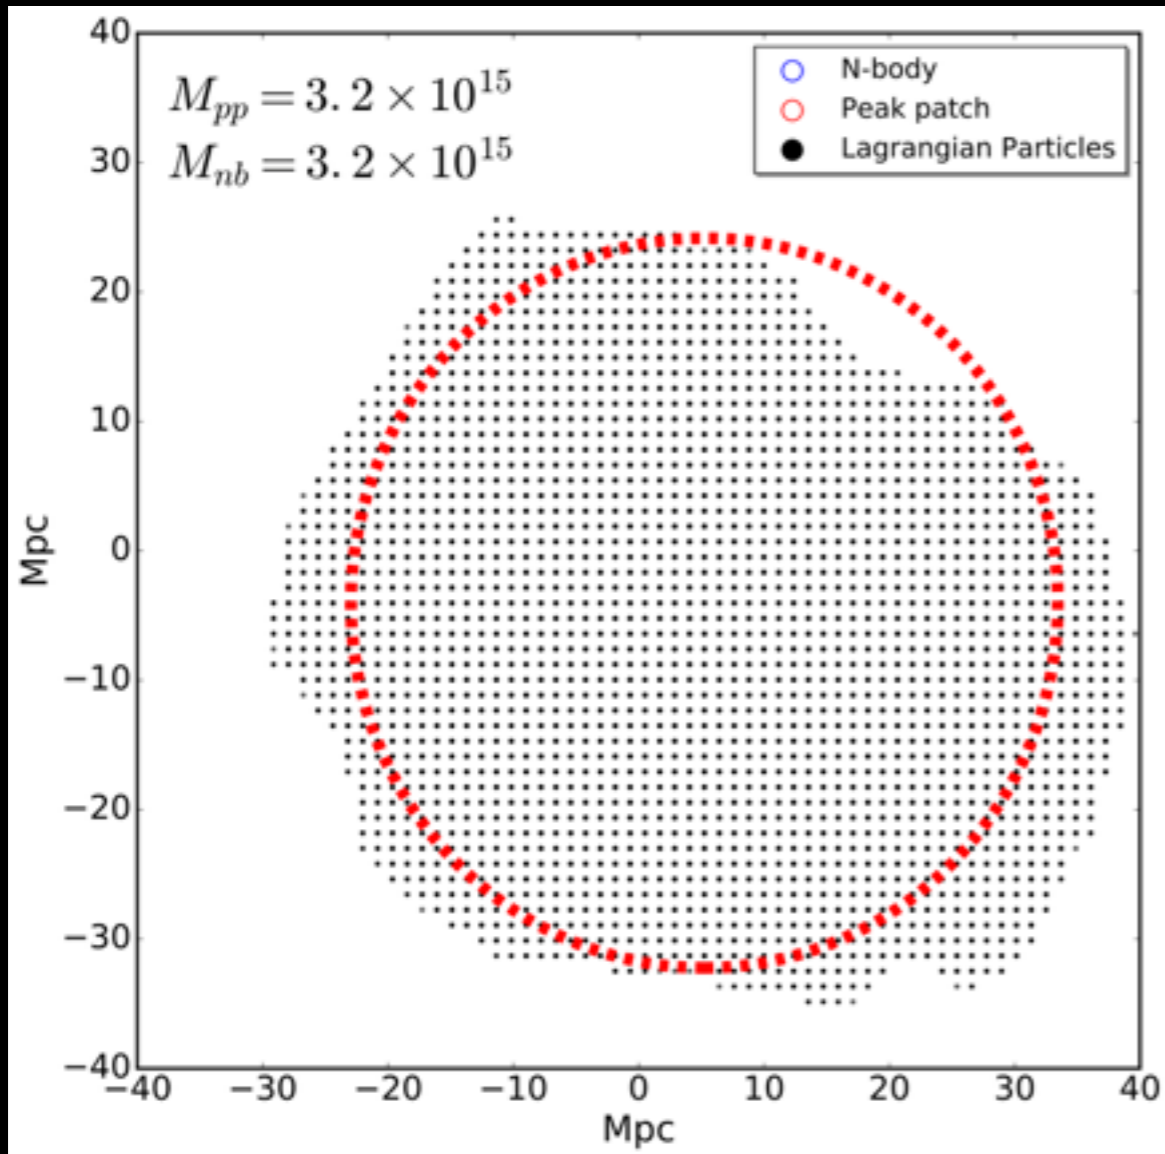

Eulerian

Lagrangian

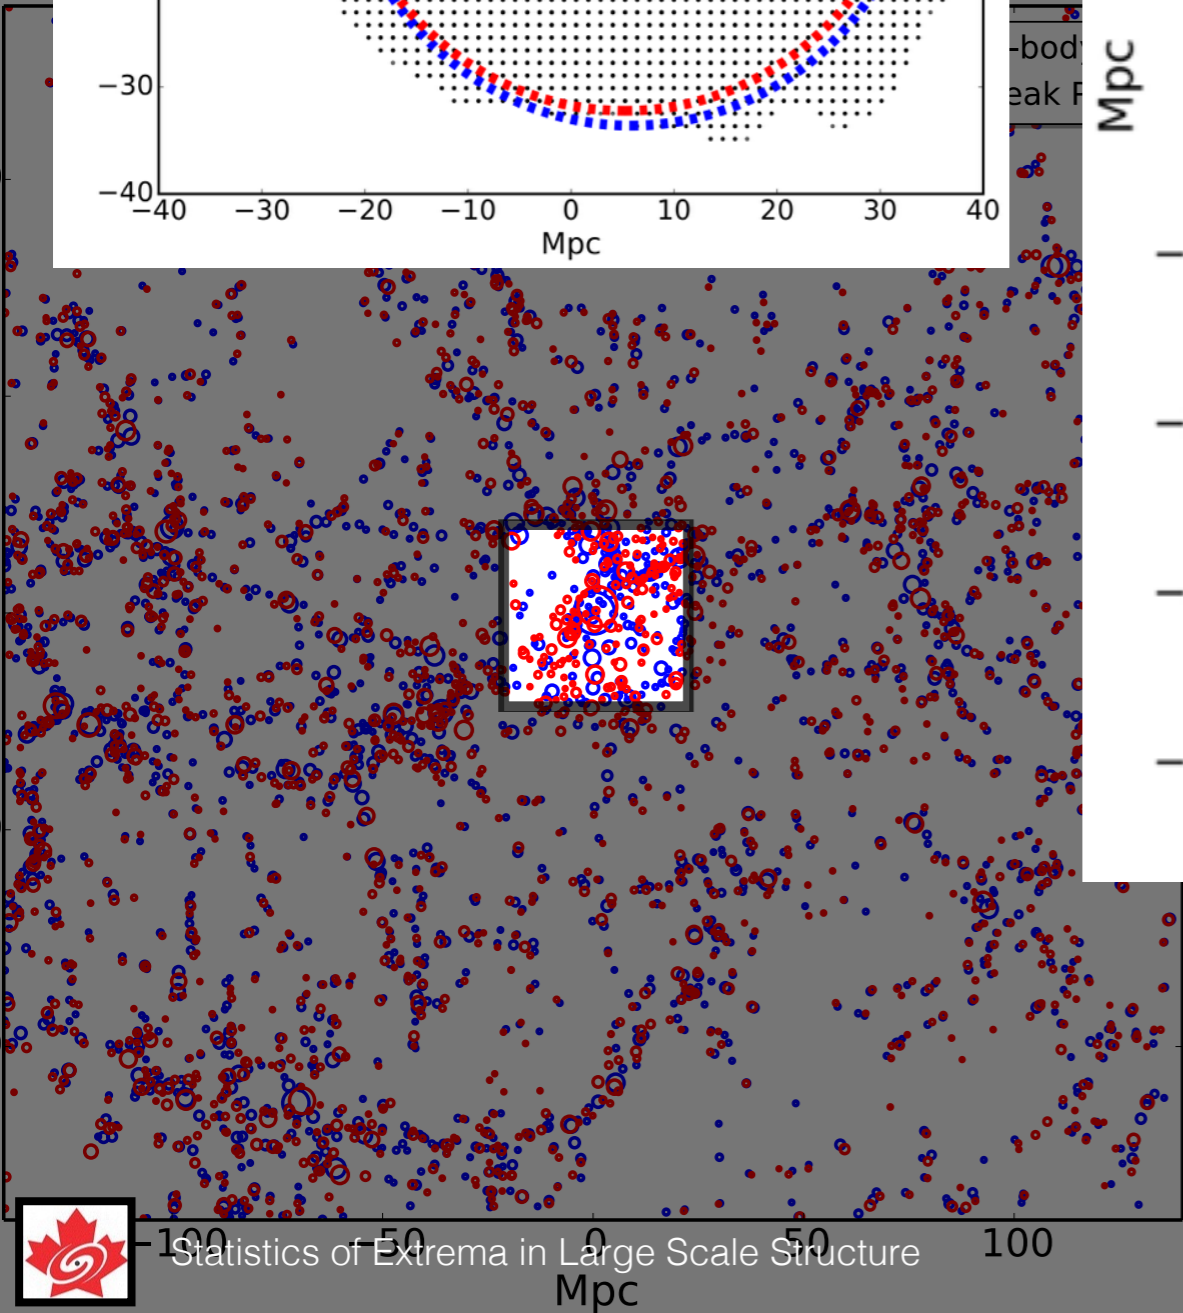

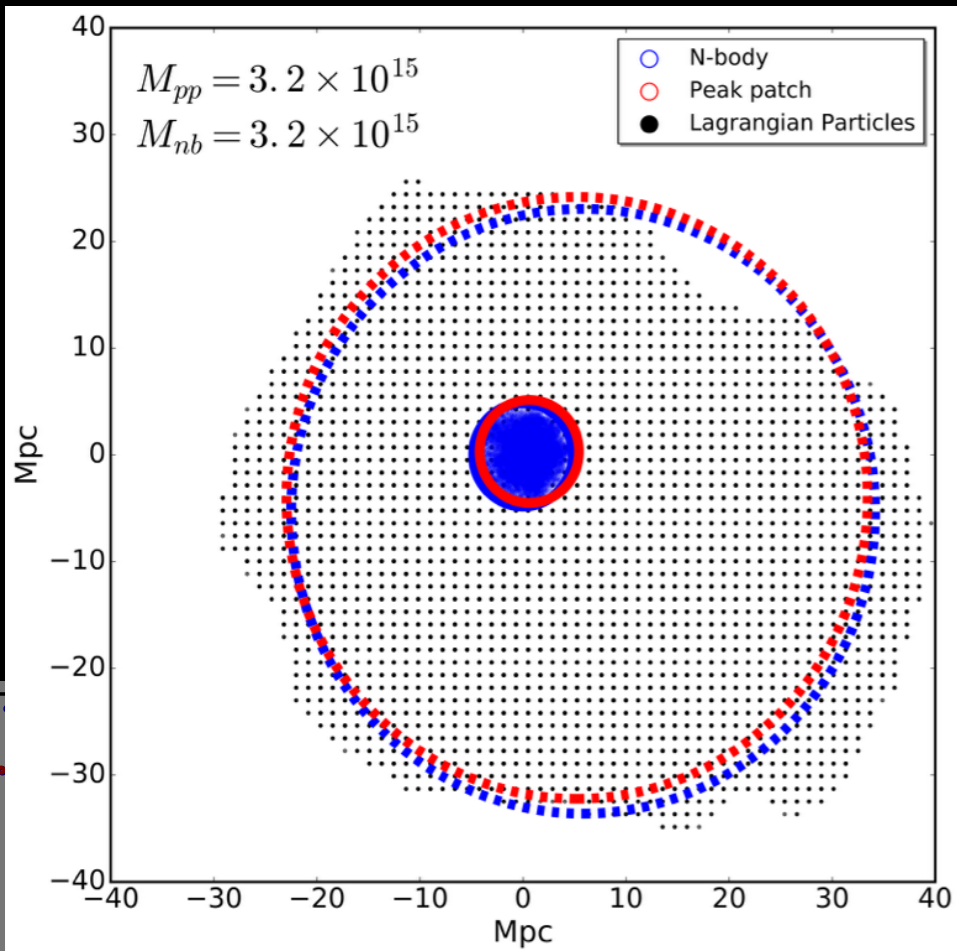

Peak-Patch

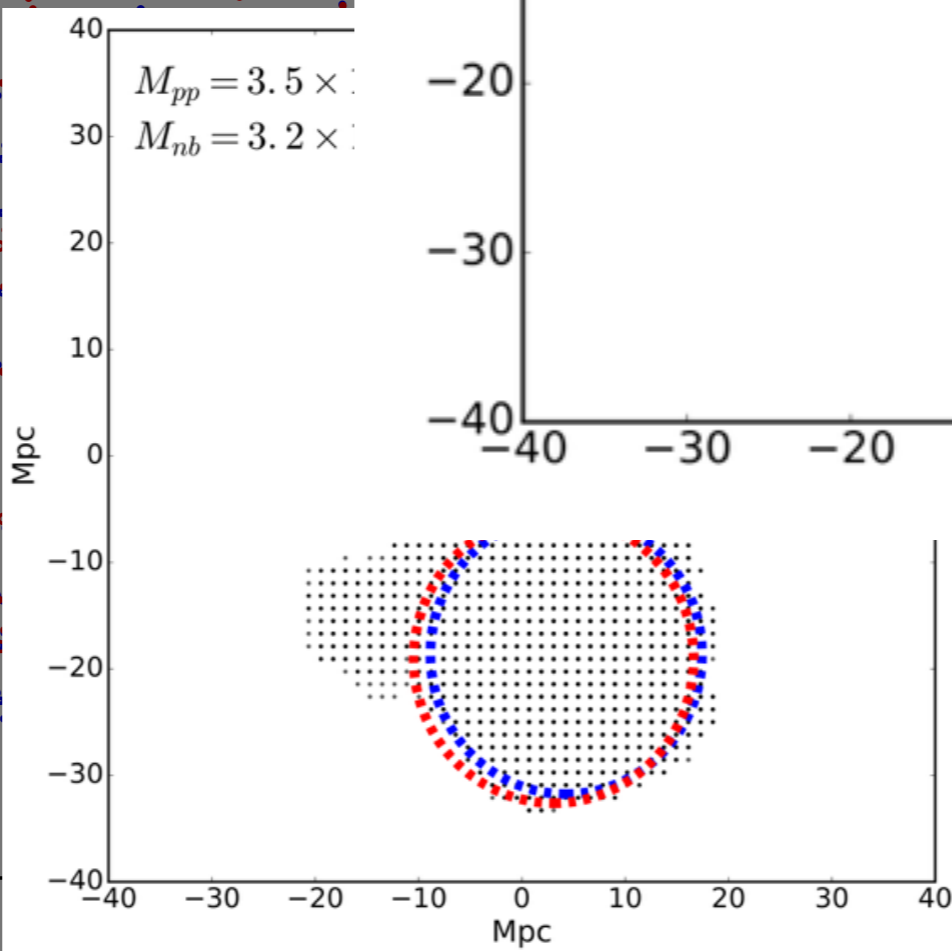

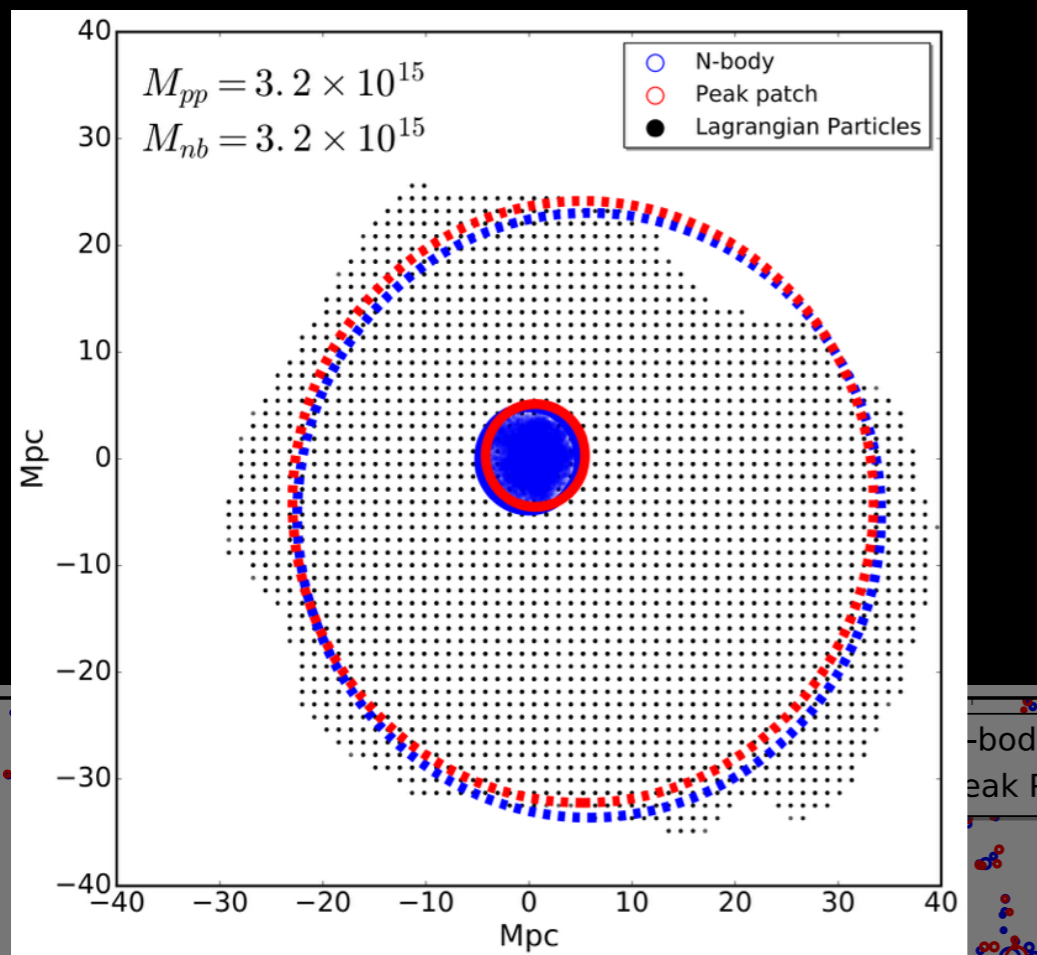

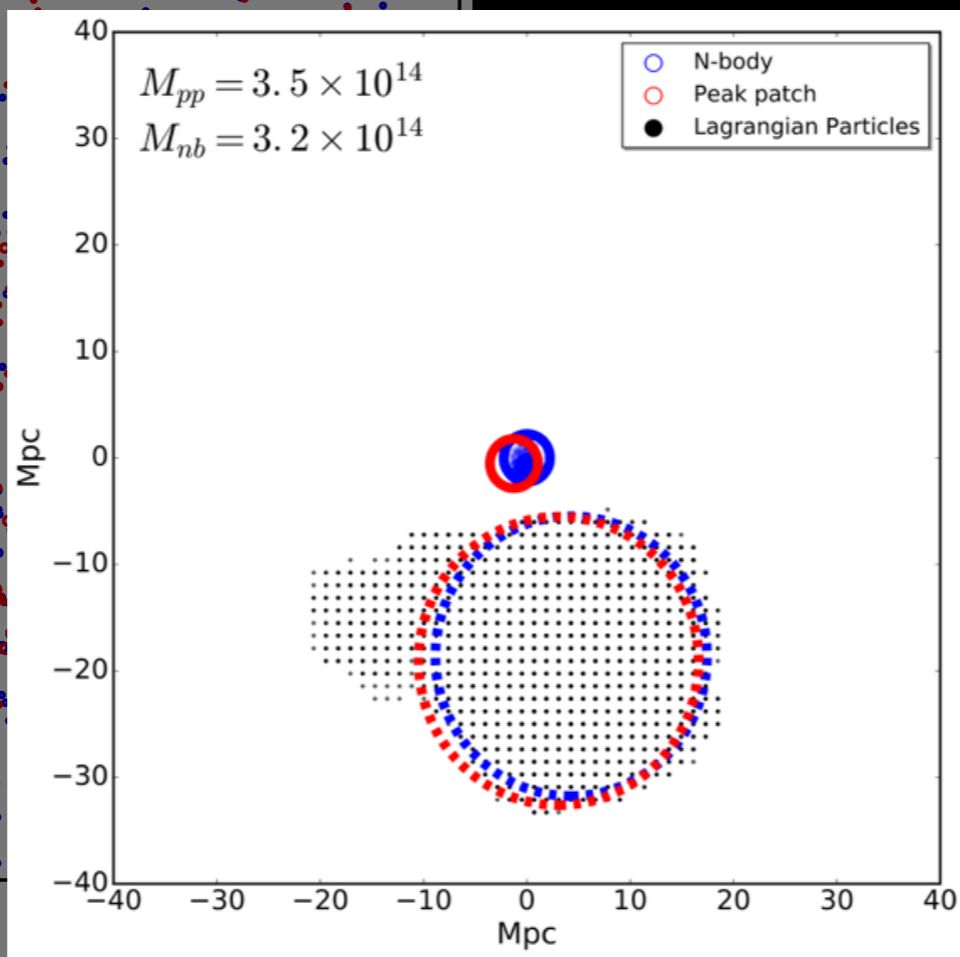

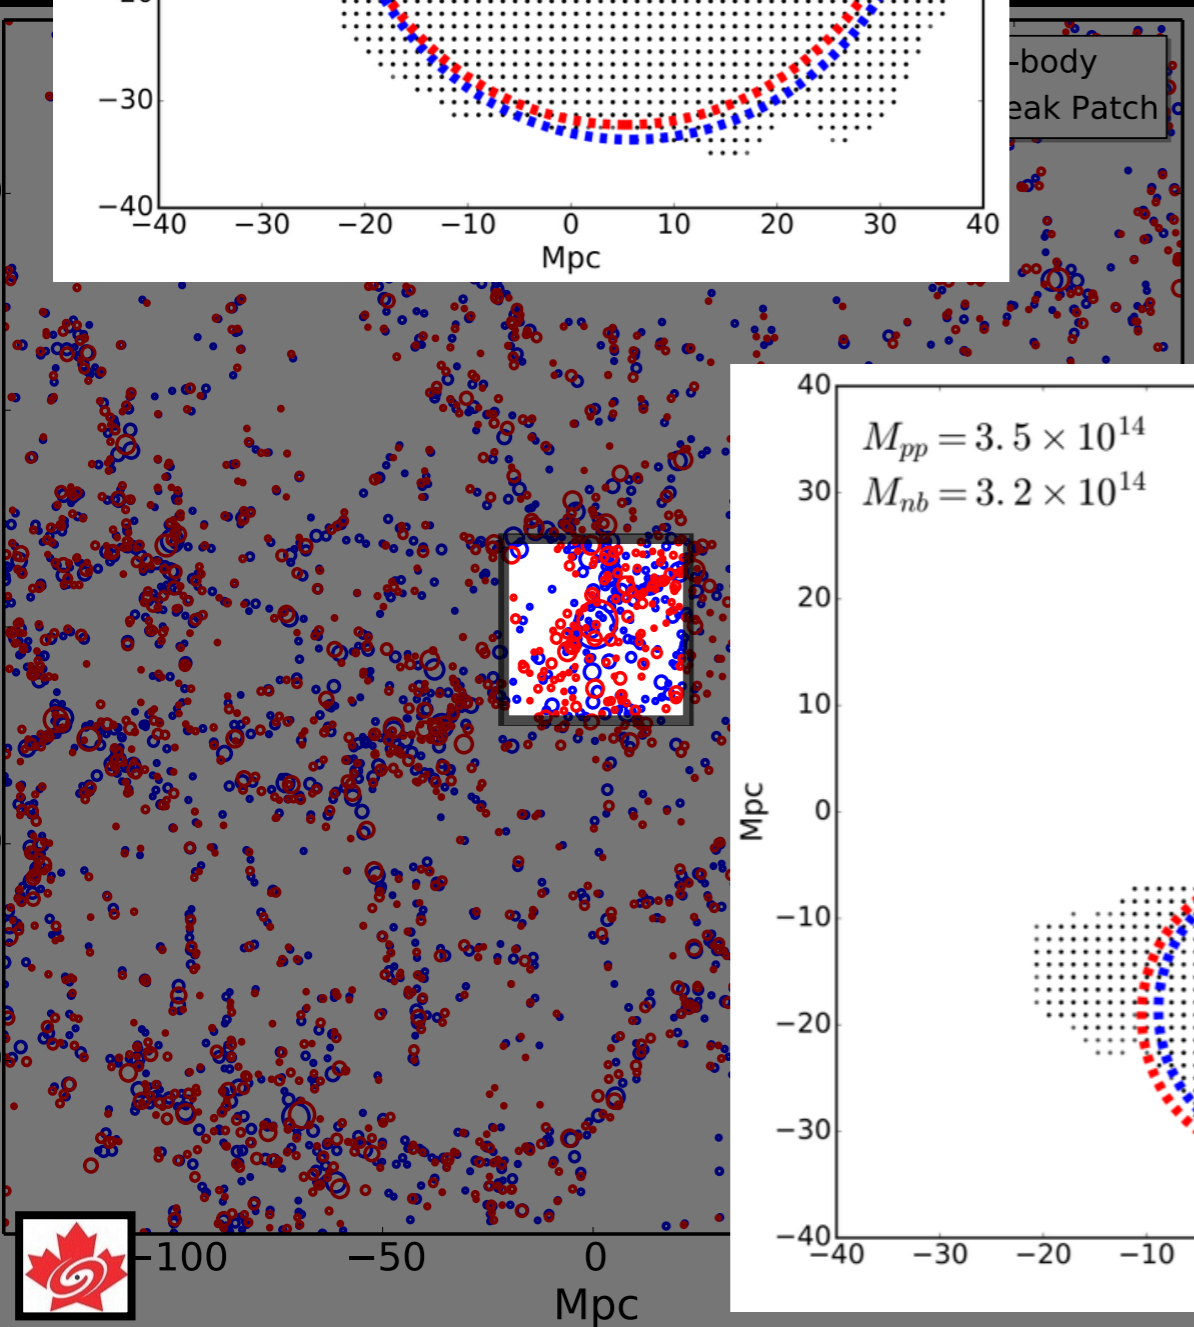

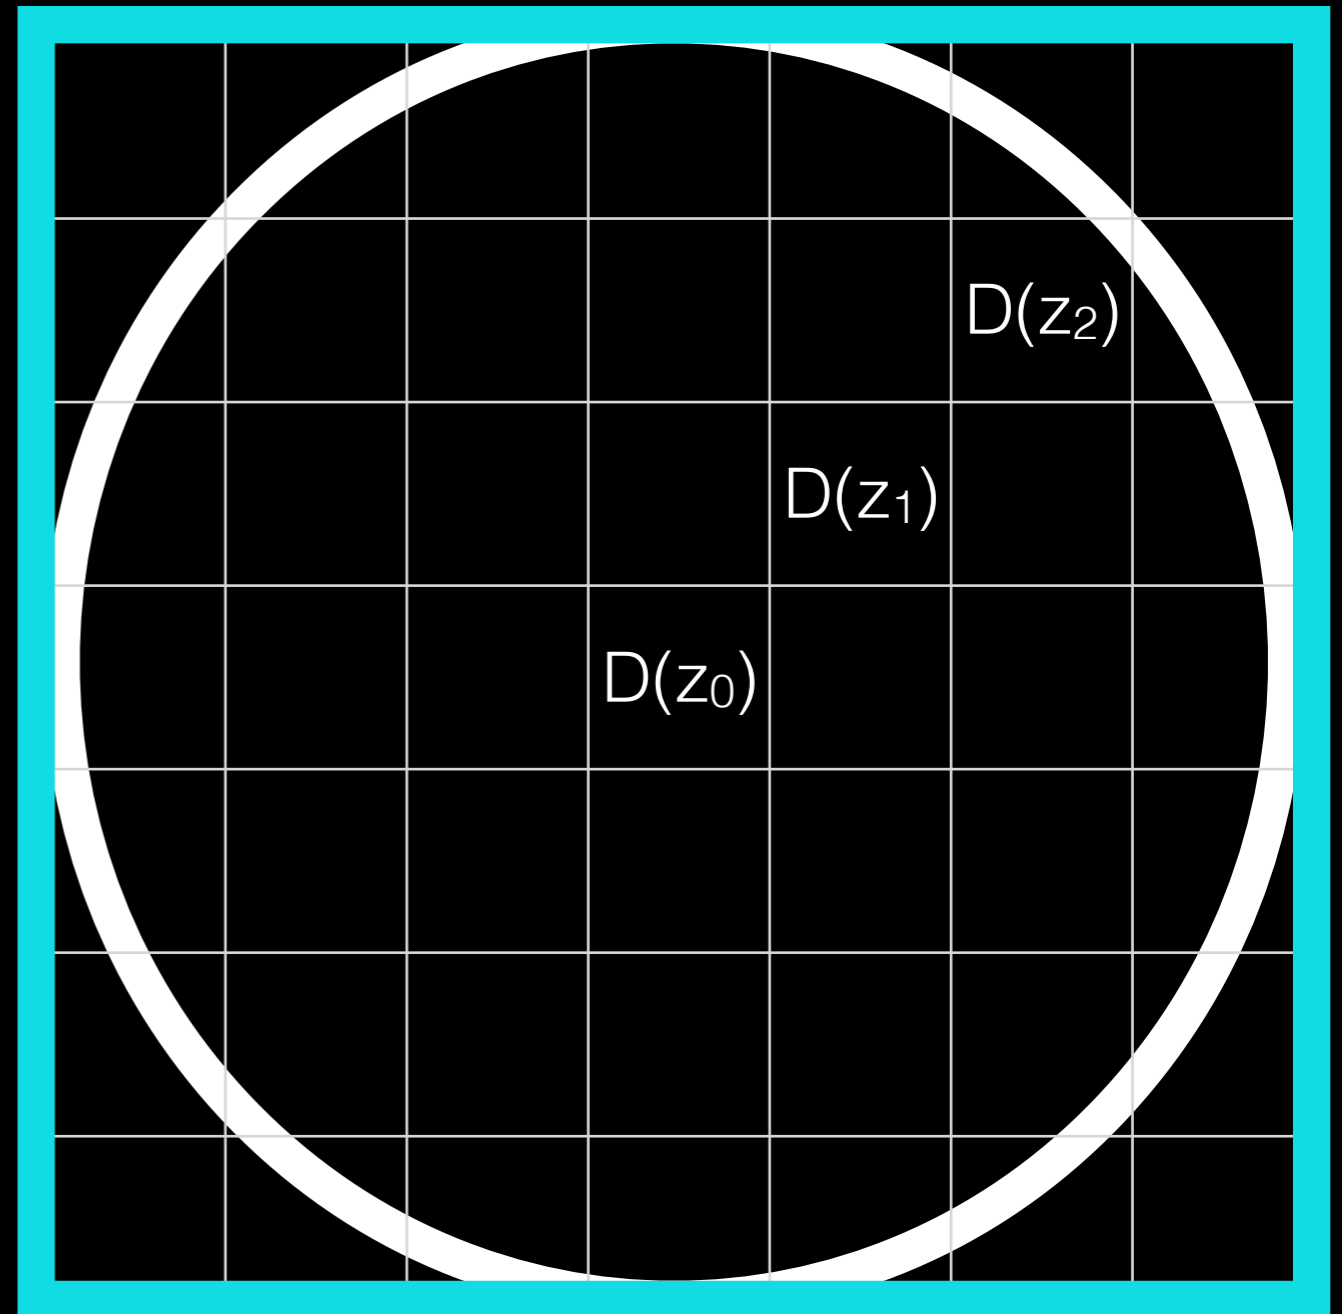

On the fly Light Cones

- Scale ICs by linear growth factor
- Calculate Ellipsoidal collapse at z_{pk}
- Save Halo

Peak Patch Full Sky Maps

8Gpc Box, 4096^3 cells

$t \sim 10$ minutes on 1024 cores

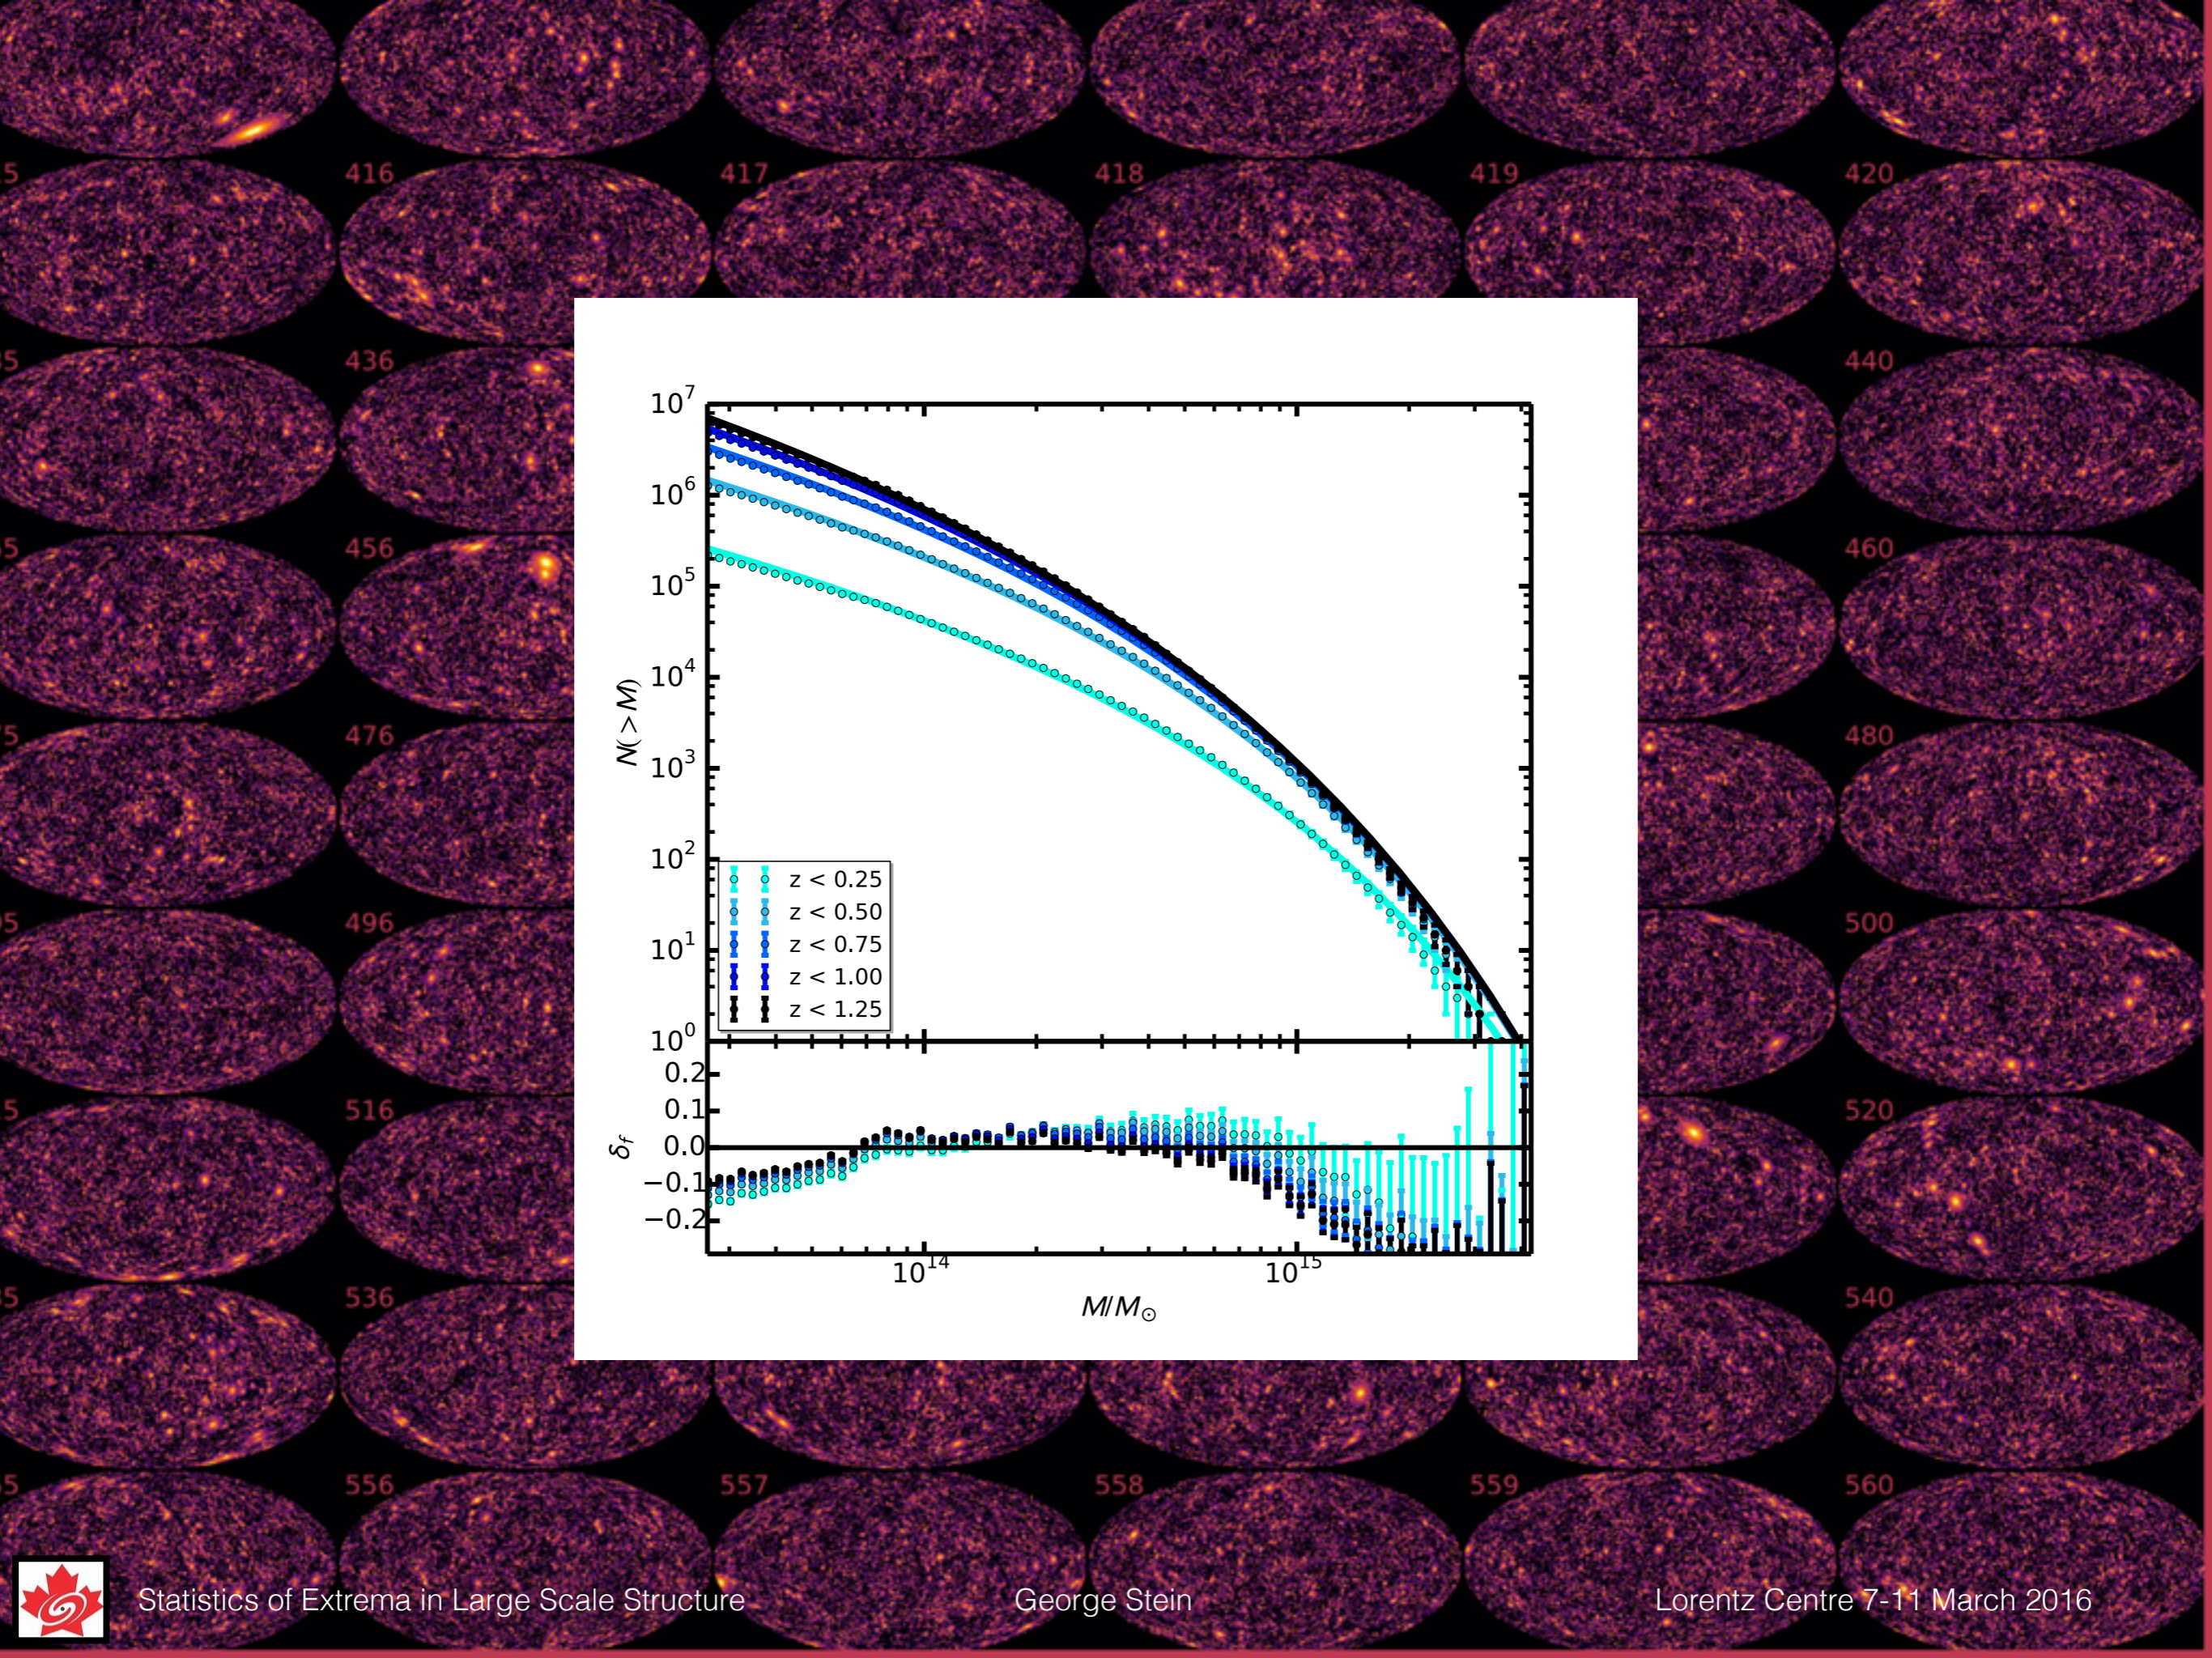

~ 60 million halos

Complete to $z < 1.25$, $M > 2.6 \times 10^{13} M_{\text{sun}}$

~ 560 maps

Halo Population

1.) Point Sources

Optical

- Manera et al. 2012

CIB

- Shang et al. 2012

Intensities

- HI, CO, C₂

2.) Extended Sources

tSZ

- BBPS 2011

kSZ

- BBPS 2011

Empirical Pressure & Gas Density Profiles

Battaglia, Bond, Pfrommer, Sievers (2011)

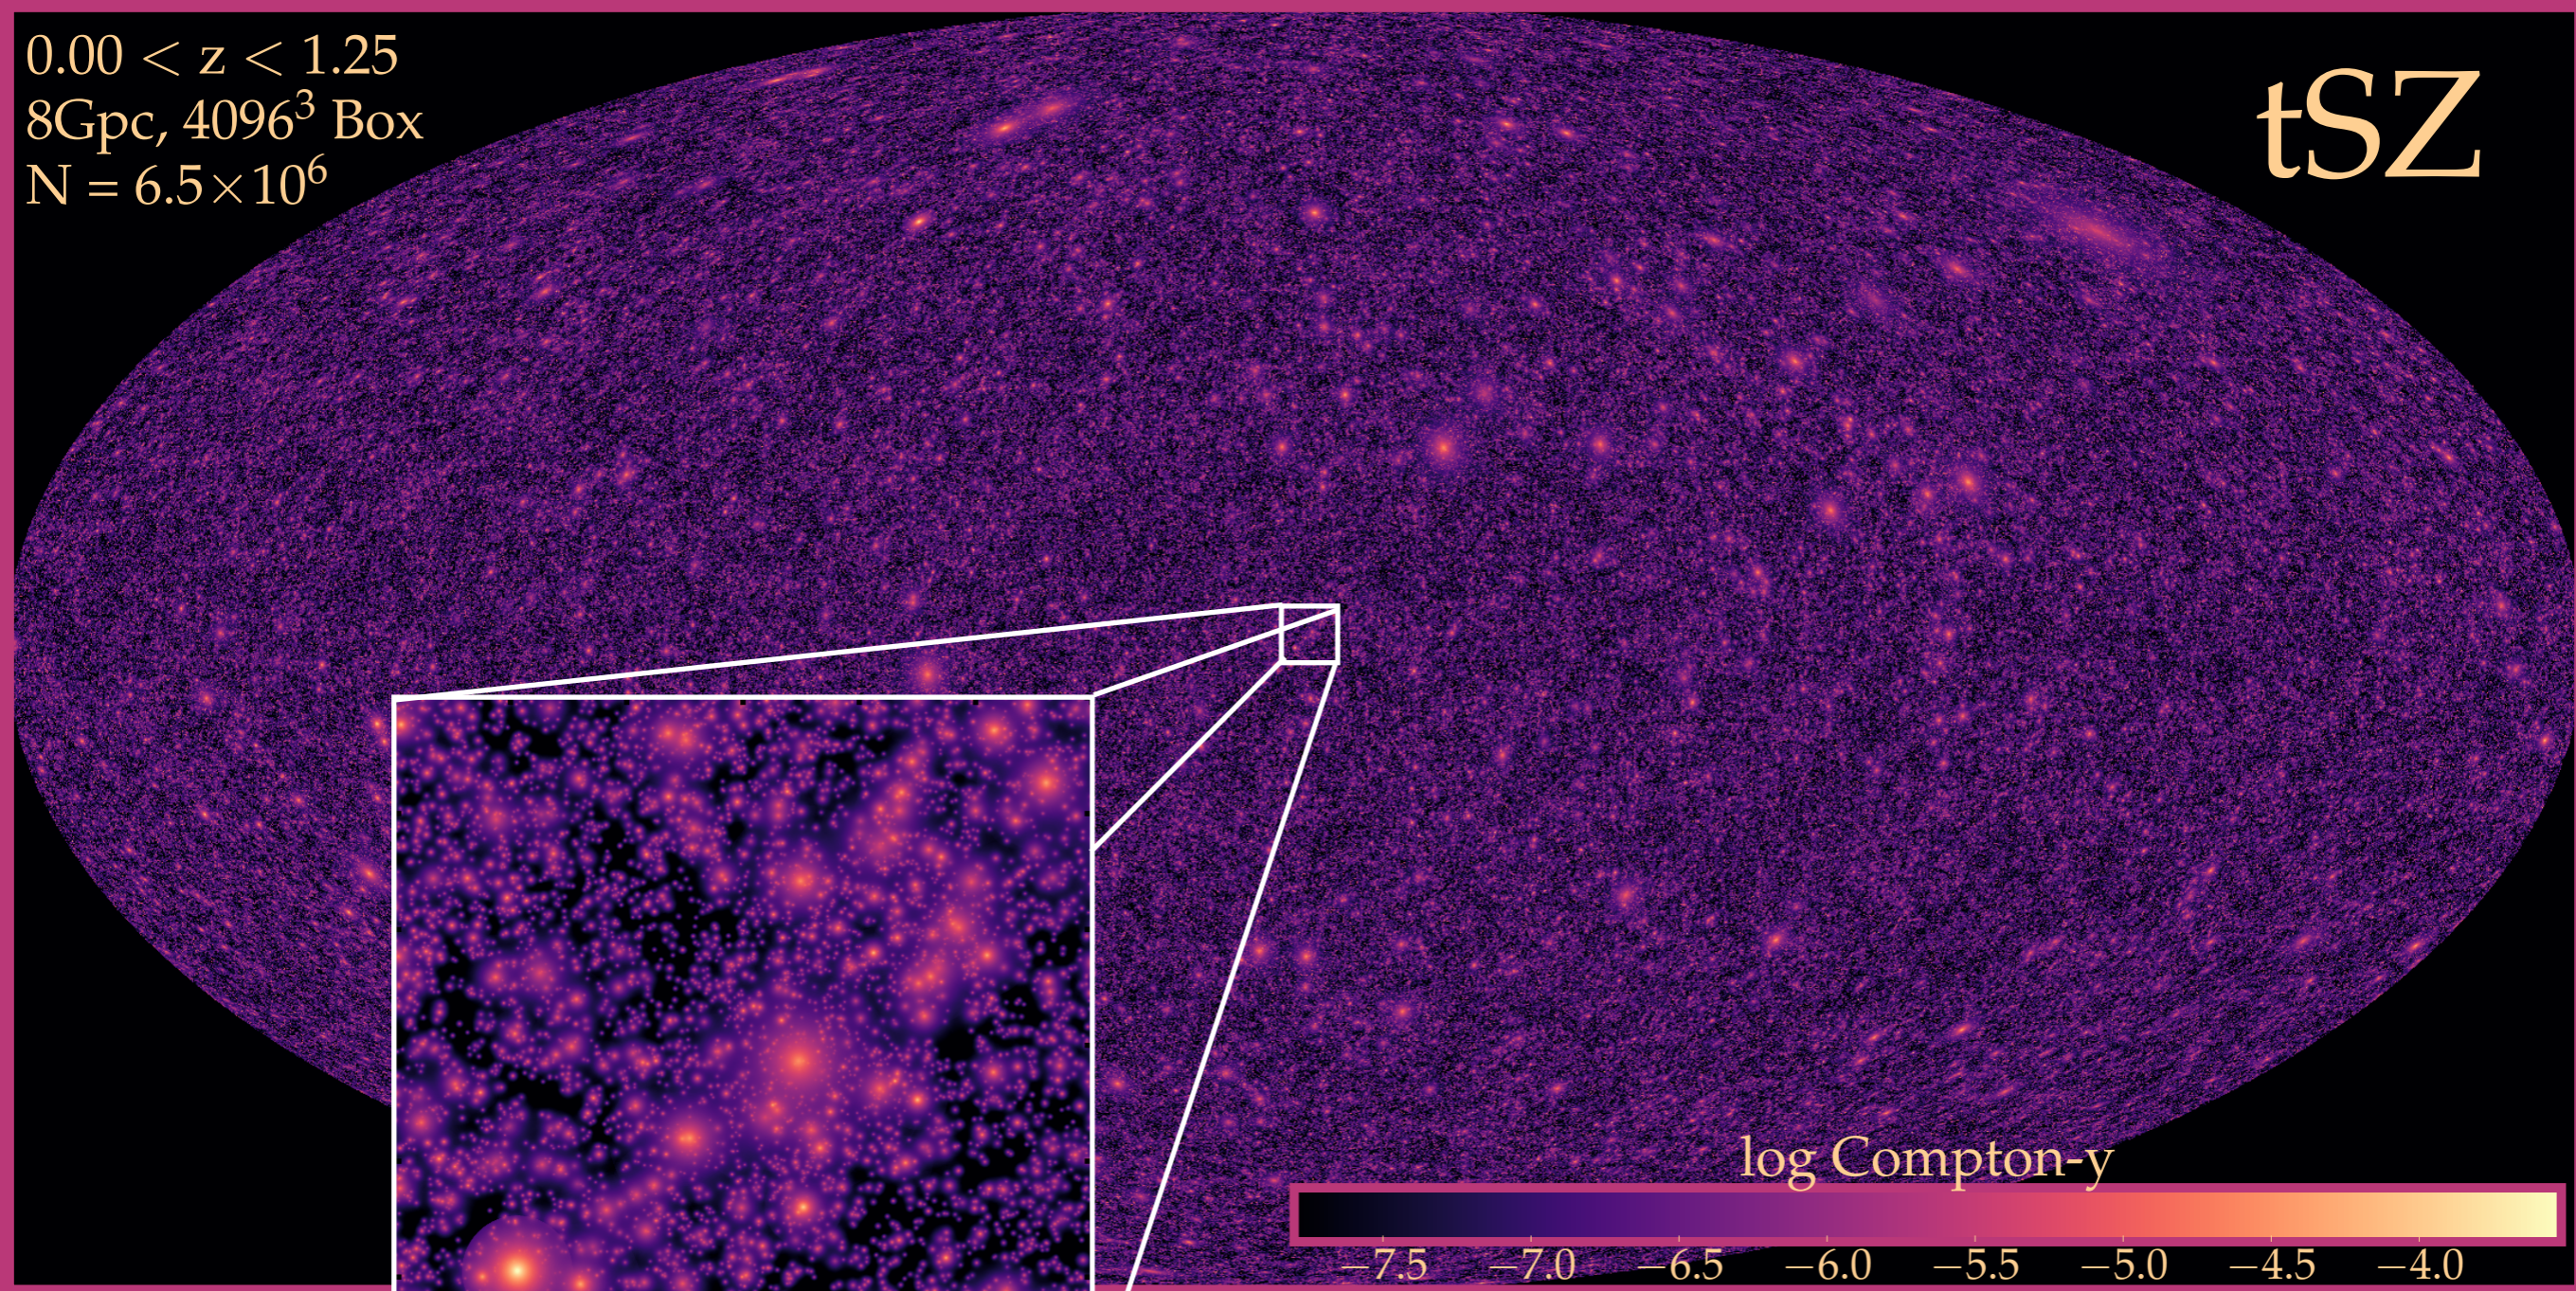

Suite of hydrodynamical TreePM-SPH simulations that include:

- radiative cooling
- star formation
- supernova feedback
- energetic feedback from AGN

$0.00 < z < 1.25$
8Gpc, 4096^3 Box
 $N = 6.5 \times 10^6$

tSZ

6 deg

$0.00 < z < 1.25$
8Gpc, 4096^3 Box
 $N = 6.5 \times 10^6$

kSZ

$\Delta T_{\text{kSZ}} [\mu\text{K}]$

6 deg

Optical HOD

- Calibrated to reproduce the clustering measurements on scales between 30 and 80 $h^{-1}\text{Mpc}$
- Satellites laid down according to excluded poisson on top of NFW profile

Manera et al. 2012

$0.00 < z < 1.25$
8Gpc, 4096^3 Box
 $N = 9.9 \times 10^6$

Optical

6 deg

CIB HOD

Shang et al. 2012

L-M relation

$$L_{(1+z)\nu}(m, z) = L_0 \Phi(z) \Sigma(m) \Theta[(1+z)\nu]$$

SED shape

- Satellites laid down according to excluded poisson on top of NFW profile

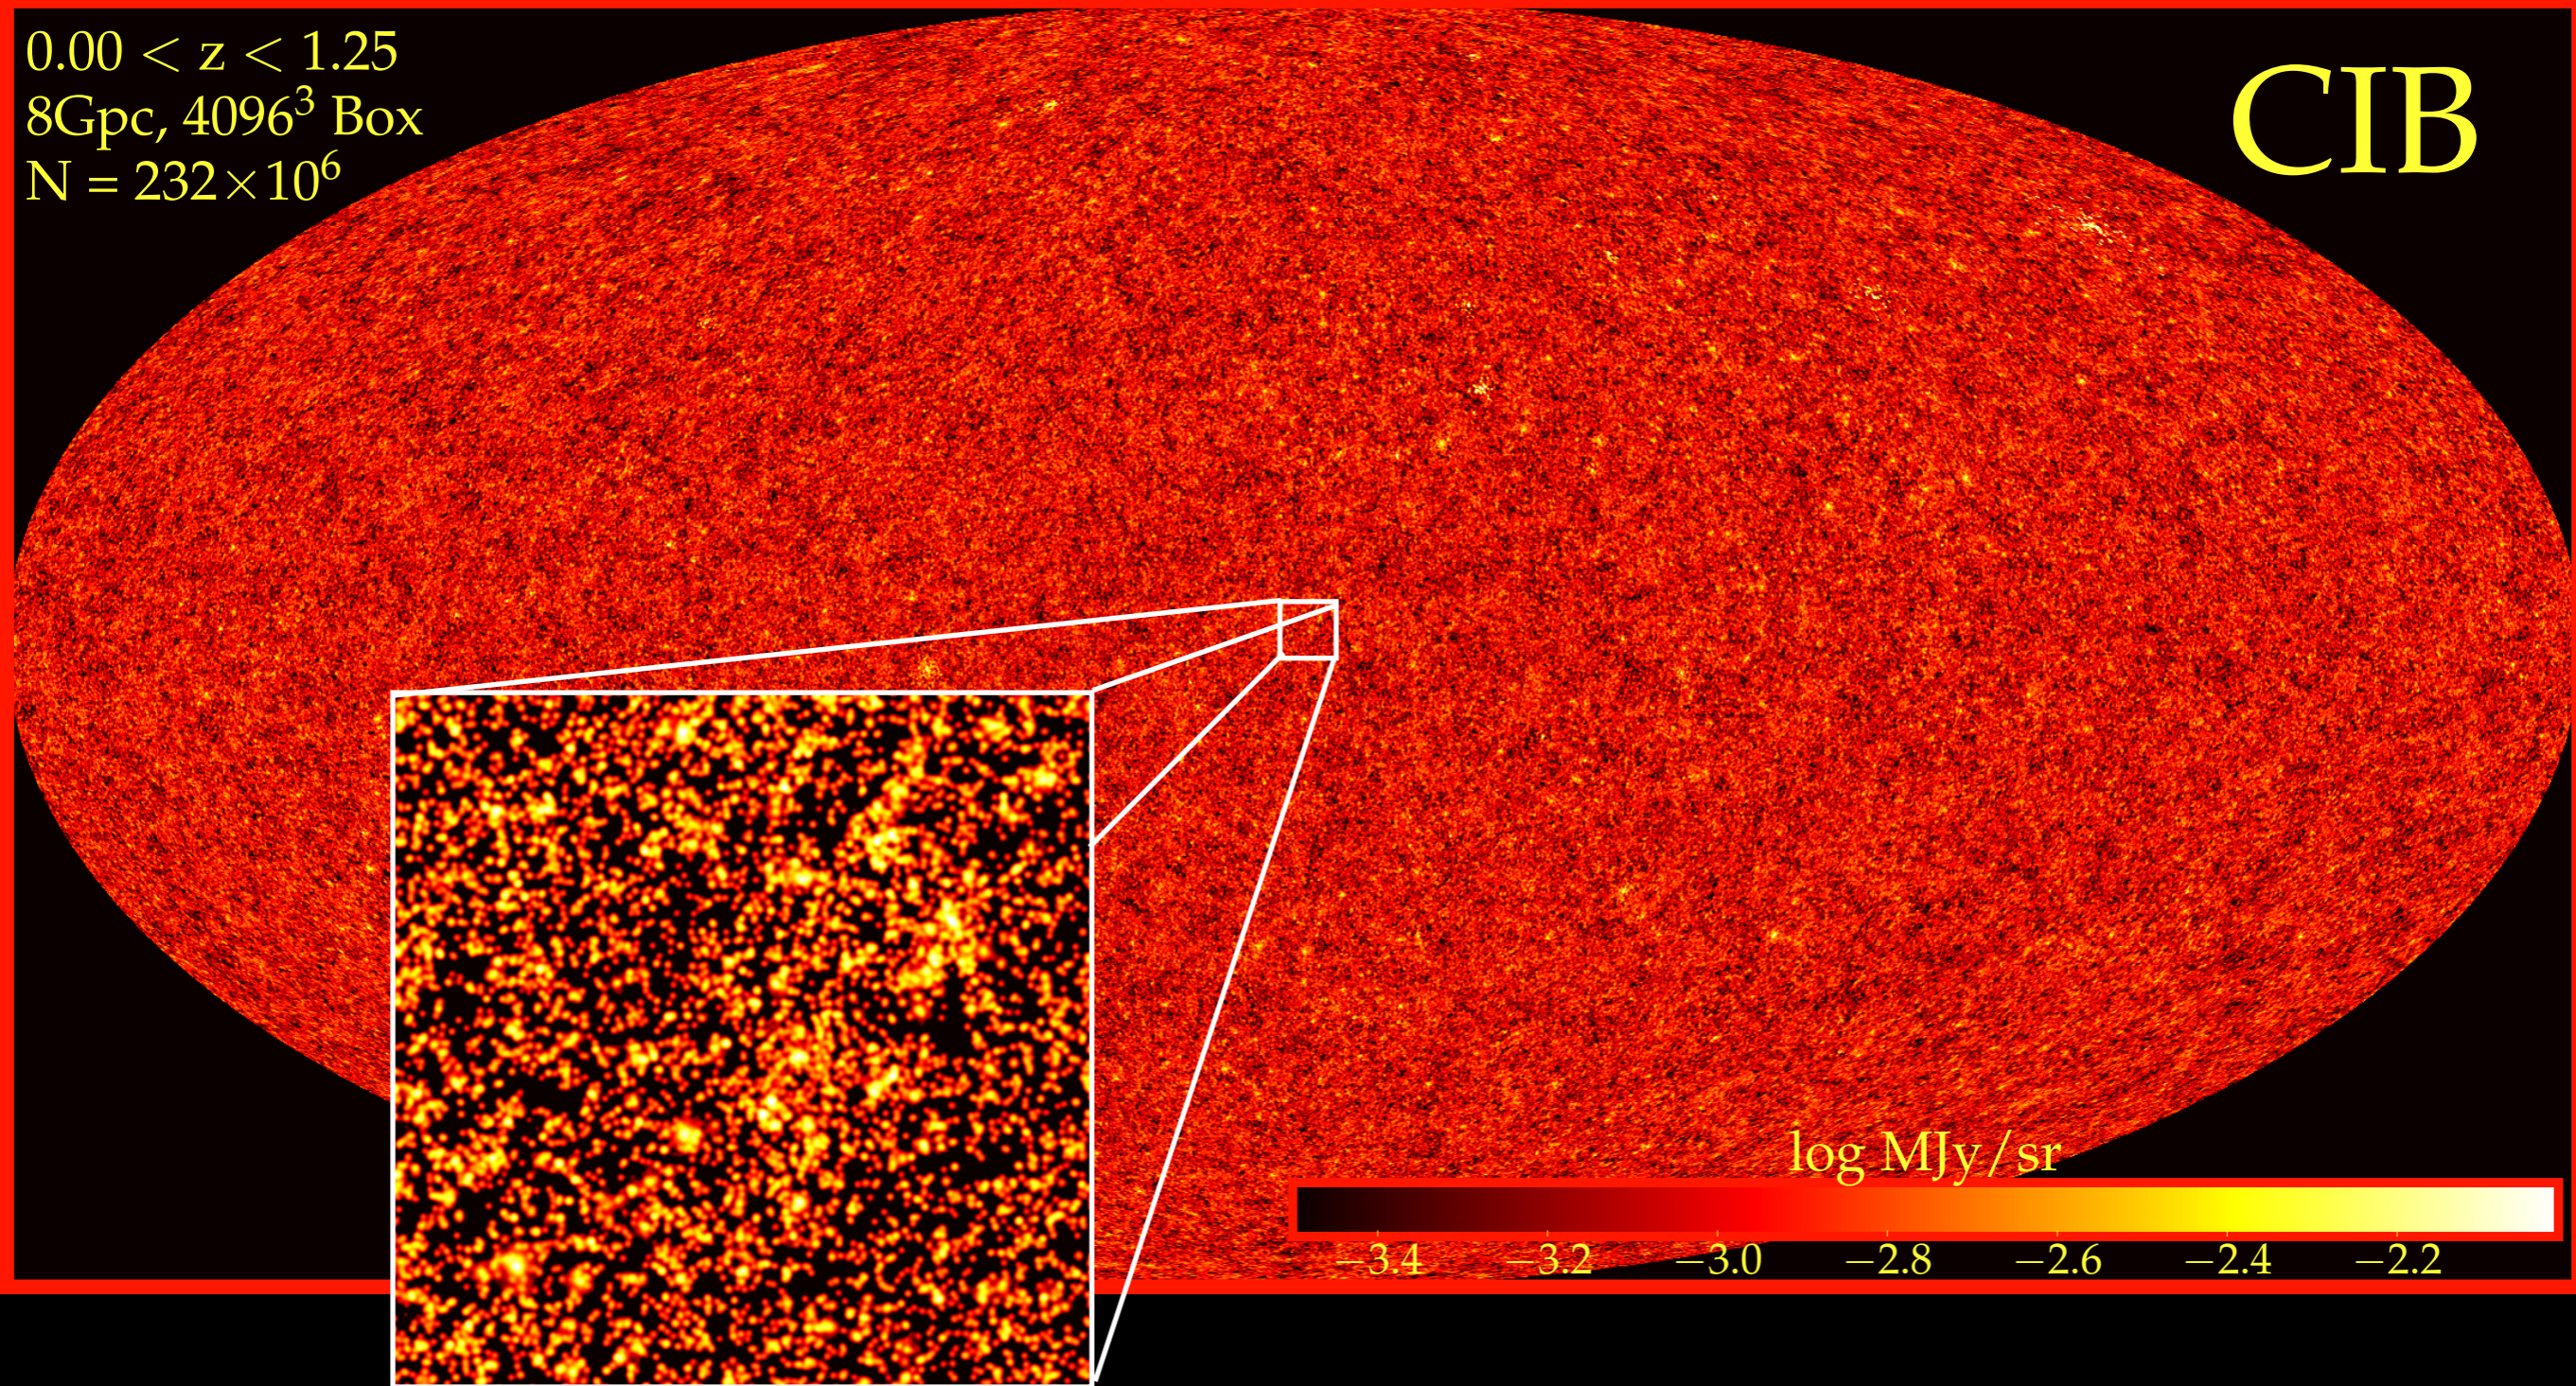

$$N_{\text{cen}} = \begin{cases} 0 & M < M_{\text{min}} \\ 1 & M \geq M_{\text{min}} \end{cases}$$

$$N_{\text{sat}} = \left(\frac{M}{M_{\text{sat}}} \right)^\alpha$$

$0.00 < z < 1.25$
8Gpc, 4096^3 Box
 $N = 232 \times 10^6$

CIB

log MJy/sr

-3.4 -3.2 -3.0 -2.8 -2.6 -2.4 -2.2

Peak Patch Full Sky Model

Multi-tracers

- Many galaxy and halo observables are correlated.
- CMB is correlated with galaxy surveys

CIB x tSZ

Optical x tSZ

Redshift Evolution

- Cross-correlation in each redshift slice picks out contribution from that slice
- Can infer growth of structure

Summary

application to Planck all-sky, Advanced ACTpol - (talk
Feb. 20 Princeton ACT mtg - Battaglia, Bond)
CMB Stage 4 - (talks Mar. 7,9 Berkeley S4 - Battaglia,
Bond)

- Peak Patch Monte Carlo mocks provide a wealth of cosmological information for parameter estimation, analyzing systematic effects, and testing pipelines
- Extremely efficient light cone simulations and halo profiles with accurate statistics
- Mocks + Mapmaking pipeline has numerous applications. tSZ, kSZ, CIB, Optical, Lensing
- Cosmic parameters - dynamical dark energy/modified gravity, neutrino mass, primordial NG (perturbative and intermittent), ...
