MAGIC I

VERITAS

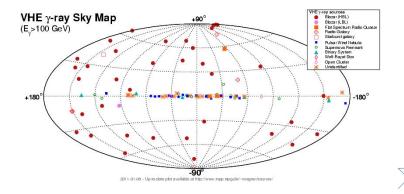

TeV emission from blazars Plasma instabilities and magnetic fields Extragalactic gamma-ray background

The TeV gamma-ray sky

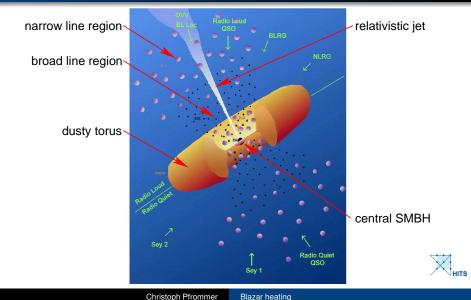

There are several classes of TeV sources:

- Galactic pulsars, BH binaries, supernova remnants
- Extragalactic mostly blazars, two starburst galaxies

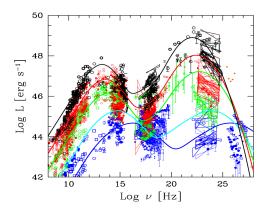

TeV emission from blazars Plasma instabilities and magnetic fields Extragalactic gamma-ray background

Unified model of active galactic nuclei

Physics of blazar heating The intergalactic medium TeV emission from blazars Plasma instabilities and magnetic fields Extragalactic gamma-ray background

The blazar sequence

Ghisellini (2011), arXiv:1104.0006

- continuous sequence from LBL–IBL–HBL
- TeV blazars are dim (very sub-Eddington)
- TeV blazars have rising spectra in the Fermi band ($\alpha < 2$)
- define TeV blazar = hard IBL + HBL

TeV emission from blazars Plasma instabilities and magnetic fields Extragalactic gamma-ray background

Propagation of TeV photons

• 1 TeV photons can pair produce with 1 eV EBL photons:

$$\gamma_{\rm TeV} + \gamma_{\rm eV}
ightarrow {\it e}^+ + {\it e}^-$$

- mean free path for this depends on the density of 1 eV photons: $\rightarrow \lambda_{\gamma\gamma} \sim (35...700)$ Mpc for z = 1...0
 - \rightarrow pairs produced with energy of 0.5 TeV ($\gamma = 10^6$)
- these pairs inverse Compton scatter off the CMB photons:
 - ightarrow mean free path is $\lambda_{\text{IC}} \sim \lambda_{\gamma\gamma}/1000$
 - \rightarrow producing gamma-rays of \sim 1 GeV

$$E\sim\gamma^2 E_{
m CMB}\sim 1~
m GeV$$

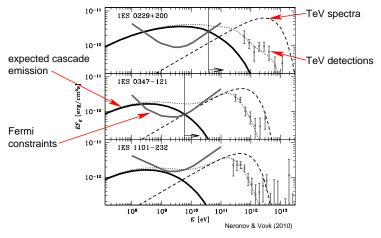

each TeV point source should also be a GeV point source

TeV emission from blazars Plasma instabilities and magnetic fields Extragalactic gamma-ray background

What about the cascade emission?

Every TeV source should be associated with a 1-100 GeV gamma-ray halo – **not seen!**

TeV emission from blazars Plasma instabilities and magnetic fields Extragalactic gamma-ray background

Measuring IGM B-fields from TeV/GeV observations

- TeV beam of e⁺/e⁻ are deflected out of the line of sight reducing the GeV IC flux → lower limit on B
- Larmor radius

$$r_{\rm L} = rac{E}{eB} \sim 30 \, \left(rac{E}{3\,{
m TeV}}
ight) \, \left(rac{B}{10^{-16}\,{
m G}}
ight)^{-1}\,{
m Mpc}$$

IC mean free path

$$x_{\text{IC}} \sim 0.1 \, \left(rac{\textit{E}}{3\,\text{TeV}}
ight)^{-1}\,\text{Mpc}$$

• for the associated 10 GeV IC photons the *Fermi* angular resolution is 0.2° or $\theta \sim 3 \times 10^{-3}$ rad

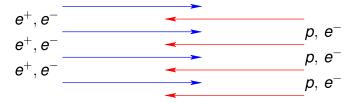

$$rac{x_{
m IC}}{r_{
m L}} > heta o B \gtrsim 10^{-16}\,{
m G}$$

TeV emission from blazars Plasma instabilities and magnetic fields Extragalactic gamma-ray background

Missing plasma physics?

How do beams of e^+/e^- propagate through the IGM?

- plasma processes are important
- interpenetrating beams of charged particles are unstable
- consider the two-stream instability:

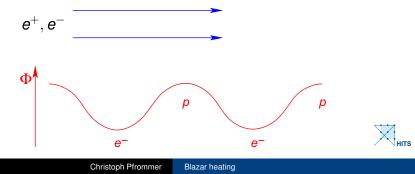

• one frequency (timescale) and one length in the problem:

TeV emission from blazars Plasma instabilities and magnetic fields Extragalactic gamma-ray background

Two-stream instability: mechanism

wave-like perturbation with $\mathbf{k} || \mathbf{v}_{\text{beam}}$, longitudinal charge oscillations in background plasma (Langmuir wave):

- initially homogeneous beam-e⁻: attractive (repulsive) force by potential maxima (minima)
- e^- attain lowest velocity in potential minima \rightarrow bunching up
- e^+ attain lowest velocity in potential maxima \rightarrow bunching up

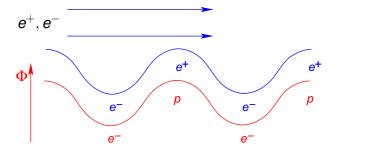

TeV emission from blazars Plasma instabilities and magnetic fields Extragalactic gamma-ray background

Two-stream instability: mechanism

wave-like perturbation with $\mathbf{k} || \mathbf{v}_{\text{beam}}$, longitudinal charge oscillations in background plasma (Langmuir wave):

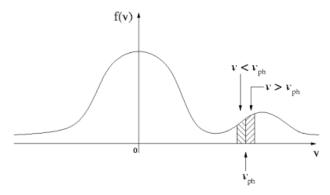

- beam-e⁺/e⁻ couple in phase with the background perturbation: enhances background potential
- stronger forces on beam- $e^+/e^-
 ightarrow$ positive feedback

• exponential wave-growth \rightarrow instability

TeV emission from blazars Plasma instabilities and magnetic fields Extragalactic gamma-ray background

Two-stream instability: energy transfer

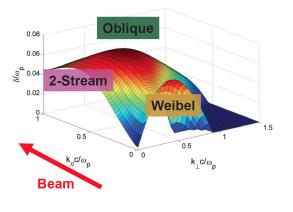

- particles with v ≥ v_{phase}: pair energy → plasma waves → growing modes
- particles with v ≤ v_{phase}: plasma wave energy → pairs → damped modes

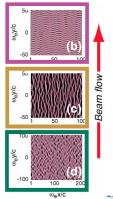

TeV emission from blazars Plasma instabilities and magnetic fields Extragalactic gamma-ray background

Oblique instability

 $\textbf{\textit{k}}$ oblique to $\textbf{\textit{v}}_{\text{beam}}$: real word perturbations don't choose "easy" alignment = \sum all orientations

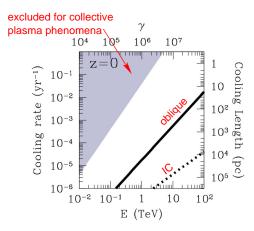

Bret (2009), Bret+ (2010)

TeV emission from blazars Plasma instabilities and magnetic fields Extragalactic gamma-ray background

Beam physics – growth rates

- consider a light beam penetrating into relatively dense plasma
- maximum growth rate

$$\sim$$
 0.4 $\gamma \, rac{\textit{n}_{\mathsf{beam}}}{\textit{n}_{\mathsf{IGM}}} \, \omega_{\textit{p}}$

 oblique instability beats IC by two orders of magnitude

Broderick, Chang, C.P. (2011)

TeV emission from blazars Plasma instabilities and magnetic fields Extragalactic gamma-ray background

Beam physics – complications

non-linear saturation:

- non-linear evolution of these instabilities at these density contrasts is not known
- expectation from PIC simulations suggest substantial isotropization of the beam
- assume that they grow at linear rate up to saturation

 \rightarrow plasma instabilities dissipate the beam's energy, no (little) energy left over for inverse Compton scattering off the CMB

TeV emission from blazars Plasma instabilities and magnetic fields Extragalactic gamma-ray background

TeV emission from blazars – a new paradigm

$$\gamma_{\text{TeV}} + \gamma_{\text{eV}} \rightarrow e^+ + e^- \rightarrow \begin{cases} \text{IC off CMB} \rightarrow \gamma_{\text{GeV}} \\ \text{plasma instabilities} \rightarrow \text{heating IGM} \end{cases}$$

absence of $\gamma_{\rm GeV}{\rm 's}$ has significant implications for . . .

- intergalactic *B*-field estimates
- γ-ray emission from blazars: spectra, background

additional IGM heating has significant implications for ...

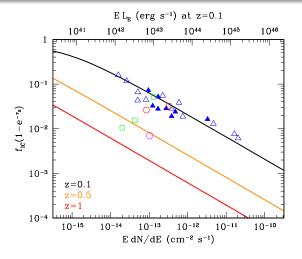

- thermal history of the IGM: Lyman- α forest
- late time structure formation: dwarfs, galaxy clusters

TeV emission from blazars Plasma instabilities and magnetic fields Extragalactic gamma-ray background

Implications for *B*-field measurements

Fraction of the pair energy lost to inverse-Compton on the CMB: $f_{IC} = \Gamma_{IC}/(\Gamma_{IC} + \Gamma_{oblique})$

TeV emission from blazars Plasma instabilities and magnetic fields Extragalactic gamma-ray background

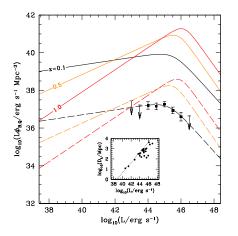

Conclusions on B-field constraints from blazar spectra

- it is thought that TeV blazar spectra might constrain IGM B-fields
- this assumes that cooling mechanism is IC off the CMB + deflection from magnetic fields
- beam instabilities may allow high-energy e⁺/e⁻ pairs to self scatter and/or lose energy
- isotropizes the beam no need for B-field
- \lesssim 1–10% of beam energy to IC CMB photons
- \rightarrow TeV blazar spectra are not suitable to measure IGM *B*-fields!

TeV emission from blazars Plasma instabilities and magnetic fields Extragalactic gamma-ray background

TeV blazar luminosity density: today

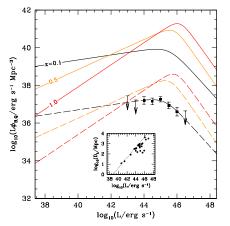

- collect luminosity of all 23 TeV blazars with good spectral measurements
- account for the selection effects (sky coverage, duty cycle, galactic occultation, TeV flux limit)
- TeV blazar luminosity density is a scaled version (η_B ~ 0.2%) of that of quasars!

Broderick, Chang, C.P. (2011)

TeV emission from blazars Plasma instabilities and magnetic fields Extragalactic gamma-ray background

Unified TeV blazar-quasar model

Quasars and TeV blazars are:

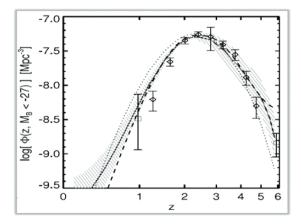

- regulated by the same mechanism
- contemporaneous elements of a single AGN population: TeV-blazar activity does not lag quasar activity
- \rightarrow assume that they trace each other for all redshifts!

Broderick, Chang, C.P. (2011)

TeV emission from blazars Plasma instabilities and magnetic fields Extragalactic gamma-ray background

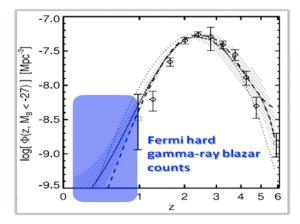

How many TeV blazars are there?

TeV emission from blazars Plasma instabilities and magnetic fields Extragalactic gamma-ray background

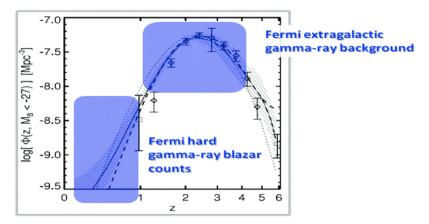

How many TeV blazars are there?

TeV emission from blazars Plasma instabilities and magnetic fields Extragalactic gamma-ray background

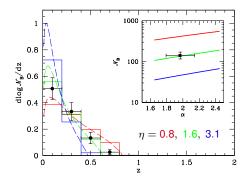

How many TeV blazars are there?

TeV emission from blazars Plasma instabilities and magnetic fields Extragalactic gamma-ray background

Fermi number count of "TeV blazars"

- number evolution of TeV blazars that are expected to have been observed by *Fermi* vs. observed evolution
- colors: different flux (luminosity) limits connecting the *Fermi* and the TeV band:

 $L_{\text{TeV},\min}(z) = \eta L_{\text{Fermi},\min}(z)$

 \rightarrow evolving (increasing) blazar population consistent with observed declining evolution (*Fermi* flux limit)!

Broderick, Chang, C.P. (2011)

TeV emission from blazars Plasma instabilities and magnetic fields Extragalactic gamma-ray background

How many TeV blazars are there at high-*z*?

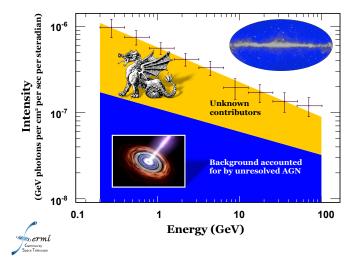

TeV emission from blazars Plasma instabilities and magnetic fields Extragalactic gamma-ray background

Fermi probes "dragons" of the gamma-ray sky

Fermi LAT Extragalactic Gamma-ray Background

TeV emission from blazars Plasma instabilities and magnetic fields Extragalactic gamma-ray background

Extragalactic gamma-ray background

• assume all TeV blazars have identical intrinsic spectra:

$$F_E = L\hat{F}_E \propto rac{1}{\left(E/E_b
ight)^{lpha_L-1} + \left(E/E_b
ight)^{lpha-1}},$$

E_b is break energy,

 $\alpha_L < \alpha$ are low and high-energy spectral indexes

• extragalactic gamma-ray background (EGRB):

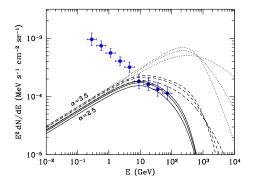

$$E^{2}\frac{dN}{dE}(E,z) = \frac{1}{4\pi}\int_{z}^{\infty}dV(z')\frac{\eta_{B}\tilde{\Lambda}_{Q}(z')\hat{F}_{E'}}{4\pi D_{L}^{2}}e^{-\tau_{E}(E',z')},$$

E' = E(1 + z') is gamma-ray energy at *emission*, $\tilde{\Lambda}_O$ is physical quasar luminosity density,

 $\eta_{B}\sim$ 0.2% is blazar fraction, τ is optical depth

TeV emission from blazars Plasma instabilities and magnetic fields Extragalactic gamma-ray background

Extragalactic gamma-ray background: varying α

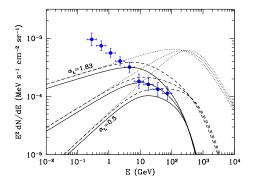

Broderick, Chang, C.P. (2011)

- dotted: unabsorbed EGRB due to TeV blazars
- dashed: absorbed EGRB due to TeV blazars
- solid: absorbed EGRB, after subtracting the resolved TeV blazars (z < 0.25)

TeV emission from blazars Plasma instabilities and magnetic fields Extragalactic gamma-ray background

Extragalactic gamma-ray background: varying α_L

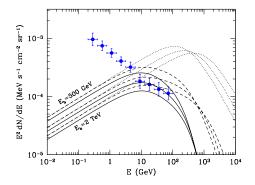

Broderick, Chang, C.P. (2011)

- dotted: unabsorbed EGRB due to TeV blazars
- dashed: absorbed EGRB due to TeV blazars
- solid: absorbed EGRB, after subtracting the resolved TeV blazars (z < 0.25)

TeV emission from blazars Plasma instabilities and magnetic fields Extragalactic gamma-ray background

Extragalactic gamma-ray background: varying E_b

Broderick, Chang, C.P. (2011)

- dotted: unabsorbed EGRB due to TeV blazars
- dashed: absorbed EGRB due to TeV blazars
- solid: absorbed EGRB, after subtracting the resolved TeV blazars (z < 0.25)

TeV emission from blazars Plasma instabilities and magnetic fields Extragalactic gamma-ray background

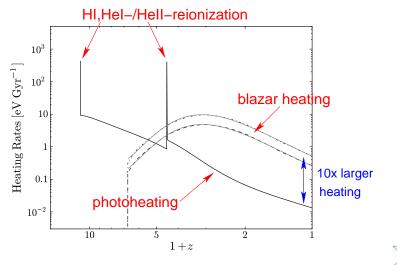

Conclusions on extragalactic gamma-ray background

- the TeV blazar luminosity density is a scaled version of the quasar luminosity density at z = 0.1
- assuming that quasars trace TeV blazars for all z and adopting typical spectra, we can match the Fermi-LAT blazar number counts and the EGRB!
- evolving blazars do not overproduce EGRB since the absorbed energy is not reprocessed to GeV energies
- fraction of absorbed energy is greater at higher energies

Properties of blazar heating Thermal history of the IGM The Lyman- α forest

Evolution of the heating rates

Chang, Broderick, C.P. (2011)

Properties of blazar heating Thermal history of the IGM The Lyman- α forest

Blazar heating vs. photoheating

- total power from AGN/stars vastly exceeds the TeV power of blazars
- $T_{\rm IGM} \sim 10^4$ K (1 eV) at mean density ($z \sim$ 2)

$$arepsilon_{
m th} = rac{kT}{m_{
m p}c^2} \sim 10^{-9}$$

• radiative energy ratio emitted by BHs in the Universe (Fukugita & Peebles 2004)

$$arepsilon_{
m rad} = \eta \, \Omega_{
m bh} \sim 0.1 imes 10^{-4} \sim 10^{-5}$$

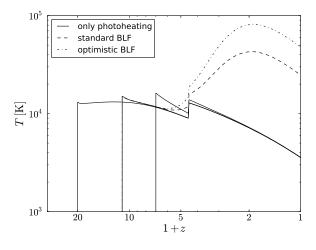

• fraction of the energy energetic enough to ionize H $\scriptscriptstyle\rm I$ is \sim 0.1:

$$arepsilon_{\text{UV}} \sim 0.1 arepsilon_{\text{rad}} \sim 10^{-6} \quad
ightarrow \quad kT \sim \text{keV}$$

- photoheating efficiency $\eta_{ph} \sim 10^{-3} \rightarrow kT \sim \eta_{ph} \varepsilon_{UV} m_p c^2 \sim eV$ (limited by the abundance of H I/He II due to the small recombination rate)
- blazar heating efficiency $\eta_{bh} \sim 10^{-3} \rightarrow kT \sim \eta_{bh} \varepsilon_{rad} m_p c^2 \sim 10 \text{ eV}$ (limited by the total power of TeV sources)

Properties of blazar heating Thermal history of the IGM The Lyman- α forest

Thermal history of the IGM

no blazar heating

Properties of blazar heating Thermal history of the IGM The Lyman- α forest

with blazar heating

Evolution of the temperature-density relation

$\underbrace{M_{L}^{10^{4}}}_{10^{3}} \underbrace{10^{4}}_{0.1} \underbrace{1+\delta}^{1}_{1+\delta} \underbrace{10^{4}}_{10^{4}} \underbrace{1+\delta}^{10^{4}}_{1+\delta} \underbrace{10^{4}}_{1+\delta} \underbrace{10^{4$

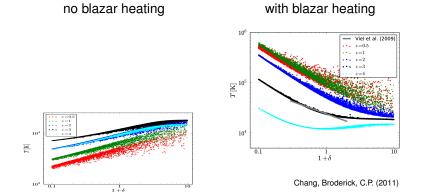

Chang, Broderick, C.P. (2011)

- blazars and extragalactic background light are uniform:
 - \rightarrow blazar heating rate independent of density
 - → makes low density regions hot
 - \rightarrow causes inverted temperature-density relation, $T\propto 1/\delta$

Properties of blazar heating Thermal history of the IGM The Lyman- α forest

Blazars cause hot voids

 blazars completely change the thermal history of the diffuse IGM and late-time structure formation

Properties of blazar heating Thermal history of the IGM The Lyman- α forest

Simulations with blazar heating

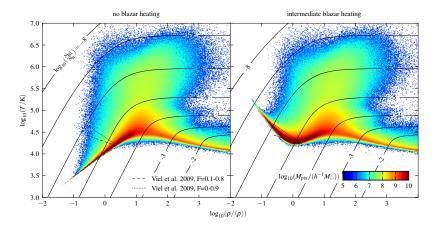

Puchwein, C.P., Springel, Broderick, Chang (2011):

- $L = 15h^{-1}$ Mpc boxes with 2 × 384³ particles
- one reference run without blazar heating
- three with blazar heating at different levels of efficiency (address uncertainty)
- used an up-to-date model of the UV background (Faucher-Giguère+ 2009)

Properties of blazar heating Thermal history of the IGM The Lyman- α forest

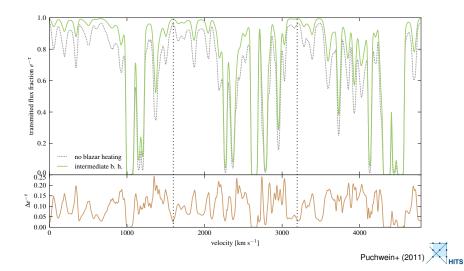

Temperature-density relation

Puchwein, C.P., Springel, Broderick, Chang (2011)

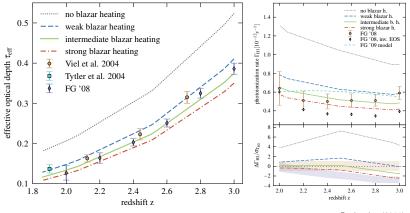

Properties of blazar heating Thermal history of the IGM The Lyman- α forest

Ly- α spectra

Properties of blazar heating Thermal history of the IGM The Lyman- α forest

The end of fudged Ly- α simulations

нітя

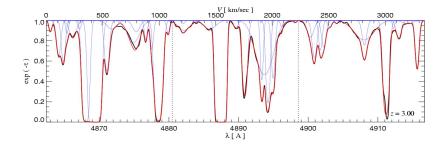

Properties of blazar heating Thermal history of the IGM The Lyman- α forest

Ly- α flux PDFs and power spectra

Properties of blazar heating Thermal history of the IGM The Lyman- α forest

Voigt profile decomposition

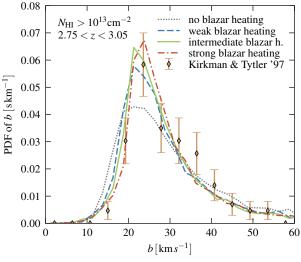

- decomposing Lyman- α forest into individual Voigt profiles
- allows studying the thermal broadening of absorption lines

Properties of blazar heating Thermal history of the IGM The Lyman- α forest

Voigt profile decomposition – line width distribution

Properties of blazar heating Thermal history of the IGM The Lyman- α forest

Lyman- α forest in a blazar heated Universe

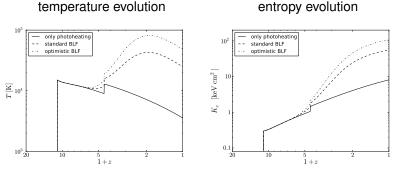

improvement in modelling the Lyman- α forest is a direct consequence of the peculiar properties of blazar heating:

- heating rate independent of IGM density \rightarrow naturally produces the inverted $T-\rho$ relation that Lyman- α forest data demand
- recent and continuous nature of the heating needed to match the redshift evolutions of all Lyman-α forest statistics
- magnitude of the heating rate required by Lyman- α forest data \sim the total energy output of TeV blazars (or equivalently $\sim 0.2\%$ of that of quasars)

Formation of dwarf galaxies Puzzles in galaxy formation Bimodality of galaxy clusters

Entropy evolution

C.P., Chang, Broderick (2011)

- evolution of entropy, $K_{\rm e} = kT n_{\rm e}^{-2/3}$, governs structure formation
- blazar heating: late-time, evolving, modest entropy floor

Formation of dwarf galaxies Puzzles in galaxy formation Bimodality of galaxy clusters

Dwarf galaxy formation – Jeans mass

- thermal pressure opposes gravitational collapse on small scales
- characteristic length/mass scale below which objects do not form
- hotter IGM \rightarrow higher IGM pressure \rightarrow higher Jeans mass:

$$M_J \propto rac{c_s^3}{
ho^{1/2}} \propto \left(rac{T_{
m IGM}^3}{
ho}
ight)^{1/2} \quad
ightarrow \quad rac{M_{J,
m blazar}}{M_{J,
m photo}} pprox \left(rac{T_{
m blazar}}{T_{
m photo}}
ight)^{3/2} \gtrsim 30$$

 \rightarrow depends on instantaneous value of c_s

- "filtering mass" depends on full thermal history of the gas: accounts for delayed response of pressure in counteracting gravitational collapse in the expanding universe
- apply corrections for non-linear collapse

Formation of dwarf galaxies Puzzles in galaxy formation Bimodality of galaxy clusters

Dwarf galaxy formation – Filtering mass

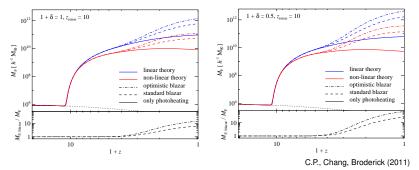

C.P., Chang, Broderick (2011)

Formation of dwarf galaxies Puzzles in galaxy formation Bimodality of galaxy clusters

Peebles' void phenomenon explained?

mean density

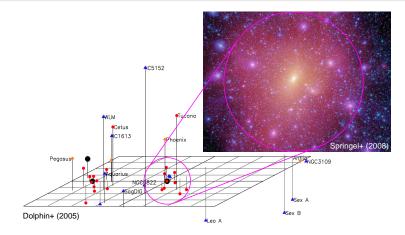

- blazar heating efficiently suppresses the formation of void dwarfs within existing DM halos of masses < 3 × 10¹¹ M_☉ (z = 0)
- may reconcile the number of void dwarfs in simulations and the paucity of those in observations

Formation of dwarf galaxies Puzzles in galaxy formation Bimodality of galaxy clusters

"Missing satellite" problem in the Milky Way

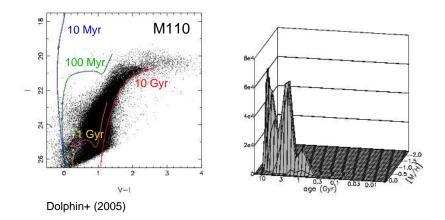

Substructures in cold DM simulations much more numerous than observed number of Milky Way satellites!

Formation of dwarf galaxies Puzzles in galaxy formation Bimodality of galaxy clusters

When do dwarfs form?

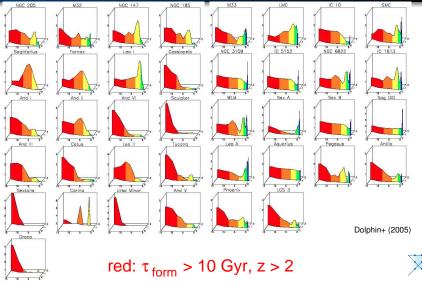

isochrone fitting for different metallicities \rightarrow star formation histories

Formation of dwarf galaxies Puzzles in galaxy formation Bimodality of galaxy clusters

When do dwarfs form?

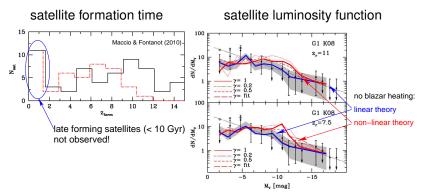

Christoph Pfrommer

Blazar heating

Formation of dwarf galaxies Puzzles in galaxy formation Bimodality of galaxy clusters

Milky Way satellites: formation history and abundance

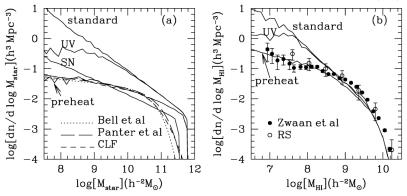

Maccio+ (2010)

 blazar heating suppresses late satellite formation, may reconcile low observed dwarf abundances with CDM simulations

Formation of dwarf galaxies Puzzles in galaxy formation Bimodality of galaxy clusters

Galactic H I-mass function

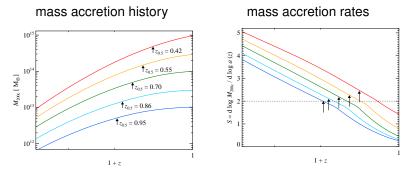

- H I-mass function is too flat (i.e., gas version of missing dwarf problem!)
- photoheating and SN feedback too inefficient
- IGM entropy floor of $K \sim 15 \,\text{keV} \,\text{cm}^2$ at $z \sim 2 3$ successful!

Formation of dwarf galaxies Puzzles in galaxy formation Bimodality of galaxy clusters

When do clusters form?

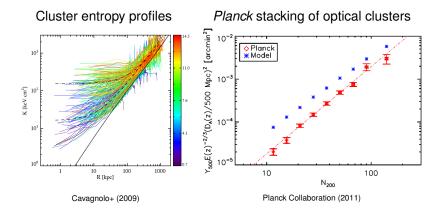

C.P., Chang, Broderick (2011)

• most cluster gas accretes after z = 1, when blazar heating can have a large effect (for late forming objects)!

Formation of dwarf galaxies Puzzles in galaxy formation Bimodality of galaxy clusters

Entropy floor in clusters

 Do optical and X-ray/Sunyaev-Zel'dovich cluster observations probe the same population? (Hicks+ 2008, Planck Collaboration 2011)

Formation of dwarf galaxies Puzzles in galaxy formation Bimodality of galaxy clusters

Entropy profiles: effect of blazar heating

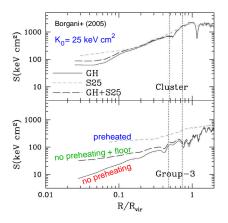

assume big fraction of intra-cluster medium collapses from IGM:

- redshift-dependent entropy excess in cores
- greatest effect for late forming groups/small clusters

Formation of dwarf galaxies Puzzles in galaxy formation Bimodality of galaxy clusters

Gravitational reprocessing of entropy floors

- greater initial entropy K_0 \rightarrow more shock heating
 - \rightarrow greater increase in K_0 over entropy floor
- net K₀ amplification of 3-5

expect:

median $K_{\rm e,0} \sim 150 \, \rm keV \, cm^2$

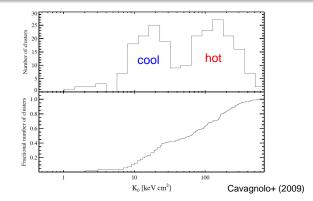

max. $K_{\rm e,0}\sim 600\,{\rm keV\,cm^2}$

Borgani+ (2005)

How efficient is heating by AGN feedback?

AGNs cannot transform CC to NCC clusters (on a buoyancy timescale)

Christoph Pfrommer Blazar heating

Formation of dwarf galaxies Puzzles in galaxy formation Bimodality of galaxy clusters

Conclusions on blazar heating

- explains puzzles in high-energy astrophysics:
 - lack of GeV bumps in blazar spectra without IGM B-fields
 - *unified TeV blazar-quasar model* explains Fermi source counts and extragalactic gamma-ray background

• novel mechanism; dramatically alters thermal history of the IGM:

- uniform and z-dependent preheating
- rate independent of density \rightarrow inverted $T-\rho$ relation
- quantitative self-consistent picture of high-z Lyman- α forest
- significantly modifies late-time structure formation:
 - suppresses late dwarf formation (in accordance with SFHs): "missing satellites", void phenomenon, H I-mass function
 - group/cluster bimodality of core entropy values
