Galactic winds

super wind in M82

NASA/JPL-Caltech/STScI/CXC/UofA

- galactic supernova remnants drive shock waves, turbulence, accelerate electrons, amplify magnetic fields
- star formation and supernovae drive gas out of galaxies by galactic super winds
- critical for understanding the physics of galaxy formation
 → explains puzzle of low star conversion efficiency in dwarf galaxies

Galactic winds and cosmic rays Mass loss and star formation Cosmic-ray heating

Galactic winds

- galactic supernova remnants drive shock waves, turbulence, accelerate electrons, amplify magnetic fields
- star formation and supernovae drive gas out of galaxies by galactic super winds
- critical for understanding the physics of galaxy formation
 → explains puzzle of low star conversion efficiency in dwarf galaxies

Galactic winds and cosmic rays Mass loss and star formation Cosmic-ray heating

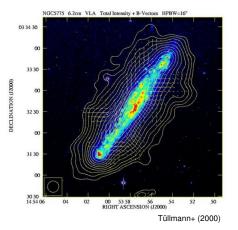

How to drive a wind?

- standard picture: wind driven by thermal pressure
- energy sources for winds: supernovae, AGN
- problem with the standard picture: fast radiative cooling
- alternative channels:
 - radiation pressure on atomic lines and dust grains?
 - cosmic rays (CRs, relativistic protons with $\gamma_{ad} = 4/3$): promising idea since observationally $\varepsilon_{CR} \simeq \varepsilon_{turb} \simeq \varepsilon_B$

∃ → < ∃ →</p>

Galactic winds and cosmic rays Mass loss and star formation Cosmic-ray heating

Radio halos in edge-on disk galaxies CRs and magnetic fields exist at the disk-halo interface \rightarrow wind launching site?

why are CRs important for wind formation?

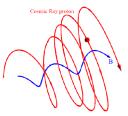

- CR pressure drops less quickly than thermal pressure $(P \propto \rho^{\gamma})$
- CRs cool less efficiently than thermal gas
- most CR energy loss goes into thermal pressure

Galactic winds and cosmic rays Mass loss and star formation Cosmic-ray heating

Interactions of CRs and magnetic fields

- CRs scatter on magnetic fields \rightarrow isotropization of CR momenta
- CR streaming instability: Kulsrud & Pearce 1969
 - if v_{cr} > v_A, CR current provides steady driving force, which amplifies an Alfvén wave field in resonance with the gyroradii of CRs
 - scattering off of this wave field limits the (GeV) CRs' bulk speed ~ v_A
 - wave damping: transfer of CR energy and momentum to the thermal gas

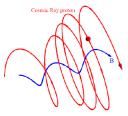

Galactic winds and cosmic rays Mass loss and star formation Cosmic-ray heating

Interactions of CRs and magnetic fields

- CRs scatter on magnetic fields \rightarrow isotropization of CR momenta
- CR streaming instability: Kulsrud & Pearce 1969
 - if v_{cr} > v_A, CR current provides steady driving force, which amplifies an Alfvén wave field in resonance with the gyroradii of CRs
 - scattering off of this wave field limits the (GeV) CRs' bulk speed ~ v_A
 - wave damping: transfer of CR energy and momentum to the thermal gas

 \rightarrow CRs exert a pressure on the thermal gas by means of scattering off of Alfvén waves

 Puzzles in galaxy formation
 Galactic winds and cosmic rays

 Driving galactic winds
 Mass loss and star formation

 AGN feedback
 Cosmic-ray heating

CR transport

- total CR velocity $\mathbf{v}_{cr} = \mathbf{v} + \mathbf{v}_{st} + \mathbf{v}_{di}$ (where $\mathbf{v} \equiv \mathbf{v}_{aas}$)
- CRs stream down their own pressure gradient relative to the gas, CRs diffuse in the wave frame due to pitch angle scattering by MHD waves (both transports are along the local direction of **B**):

$$\mathbf{v}_{st} = -v_{A} \, rac{\mathbf{\nabla} P_{cr}}{|\mathbf{\nabla} P_{cr}|} ext{ with } v_{A} = \sqrt{rac{\mathbf{B}^{2}}{4\pi
ho}}, \qquad \mathbf{v}_{di} = -\kappa_{di} \, rac{\mathbf{\nabla} P_{cr}}{P_{cr}},$$

CR streaming drives winds

Christoph Pfrommer

Puzzles in galaxy formation Driving galactic winds AGN feedback Galactic winds and cosmic ray Mass loss and star formation Cosmic-ray heating

Wind velocity profile along the symmetry axis

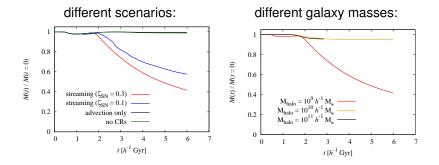

- 10⁹ − 10¹⁰ M_☉: accelerating wind due to a continuous CR momentum and energy deposition during the ascent of the wind in the gravitational potential
 - \rightarrow different from traditional energy- or momentum-driven winds!
- 10¹¹ M_☉: wind stalls in halo and falls back onto the disk
 → fountain flow

< 🗇 🕨

Puzzles in galaxy formation Driving galactic winds AGN feedback Galactic winds and cosmic ra Mass loss and star formation Cosmic-ray heating

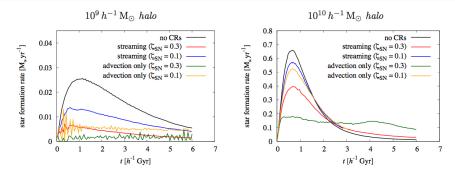

Gas mass loss within the virial radius

- after initial phase (~ 2.5 Gyr), only winds driven by CR streaming overcome the ram pressure of infalling gas and expel gas from the halo
- mass loss rate increases with CR injection efficiency ζ_{SN} (*left*) and toward smaller galaxy masses (*right*)

Galactic winds and cosmic rays Mass loss and star formation Cosmic-ray heating

Star formation histories (SFHs)

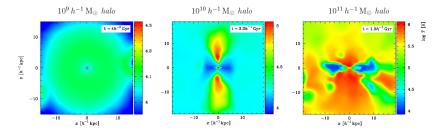

• CR feedback suppresses star formation

- 10⁹ M_☉: CR advection-only (green, yellow): oscillating SFH CR streaming (red, blue): suppressed smooth SFH
- $10^{10} \, M_{\odot}$: suppressed smooth SFH

Galactic winds and cosmic rays Mass loss and star formation Cosmic-ray heating

Temperature structure due to CR heating

- halo temperatures scale as $kT \propto v_{
 m wind}^2 \sim v_{
 m esc}^2$
- $10^9 \rightarrow 10^{10} M_{\odot}$: transition of isotropic to bi-conical wind; in these cones, CR wave heating overcomes radiative cooling
- 10¹⁰ → 10¹¹ M_☉: broadening of hot temperature structure due to inability of CR streaming to drive a sustained wind; instead, fountain flows drive turbulence, thereby heating larger regions

イロト イポト イヨト イヨト

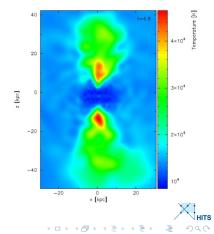

Galactic winds and cosmic rays Mass loss and star formation Cosmic-ray heating

Gas temperature: observation vs. simulation

M82 observation

CR streaming $(10^{10} M_{\odot})$

 Puzzles in galaxy formation
 Galactic winds and cosmic rays

 Driving galactic winds
 Mass loss and star formation

 AGN feedback
 Cosmic-ray heating

CR-driven winds: analytics versus simulations Bernoulli theorem along streamlines: wind speeds and mass loading factors

- winds speeds increase with galaxy mass as $v_{\text{wind}} \propto v_{\text{circ}} \propto M_{200}^{1/3}$ until they cutoff around $10^{11} \text{ M}_{\odot}$ due to a fixed wind base height (set by radiative physics)
- mass loading factor $\eta = \dot{M}/SFR$ decreases with galaxy mass

Galactic winds and cosmic rays Mass loss and star formation Cosmic-ray heating

Conclusions on cosmic-ray driven winds in galaxies

- galactic winds are naturally explained by CR streaming (known energy source and plasma physics)
- CR streaming heating can explain observed hot wind regions above disks
- substantial mass losses of low mass galaxies

 \rightarrow opportunity for understanding the physics at the faint end of galaxy luminosity function

outlook: improved hydrodynamics (AREPO), including MHD (anisotropic transport), improved modeling of plasma physics, cosmological settings, ...

- high-ν: freshly accelerated CR electrons low-ν: fossil CR electrons → time-integrated AGN feedback!
- LOFAR: halo confined to same region at all frequencies and no low-ν spectral steepening → puzzle of "missing fossil electrons"

Observations of M87 Cosmic-ray heating Conclusions

Solutions to the "missing fossil electrons" problem

solutions:

special time: M87 turned on

 40 Myr ago after long
 silence
 ⇔ conflicts order unity duty
 cycle inferred from stat. AGN
 feedback studies (Birzan+ 2012)

Observations of M87 Cosmic-ray heating Conclusions

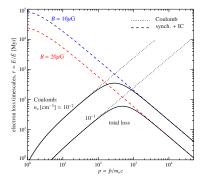

Solutions to the "missing fossil electrons" problem

solutions:

 special time: M87 turned on ~ 40 Myr ago after long silence

⇔ conflicts order unity duty cycle inferred from stat. AGN feedback studies (Birzan+ 2012)

• Coulomb cooling removes fossil electrons \rightarrow efficient mixing of CR electrons and protons with dense cluster gas \rightarrow predicts γ rays from CRp-p interactions: $p + p \rightarrow \pi^0 + ... \rightarrow 2\gamma + ...$

C.P. (2013)

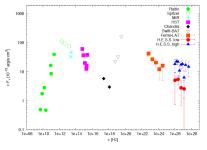

Observations of M87 Cosmic-ray heating Conclusions

The gamma-ray picture of M87

- high state is time variable
 → jet emission
- low state:
 (1) steady flux
 - (2) γ -ray spectral index (2.2)
 - = CRp index
 - CRe injection index as probed by LOFAR

(3) spatial extension is under investigation (?)

Rieger & Aharonian (2012)

 \rightarrow confirming this triad would be smoking gun for first γ -ray signal from a galaxy cluster!

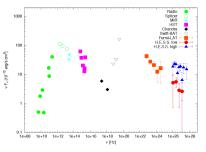

Observations of M87 Cosmic-ray heating Conclusions

Estimating the CR pressure in M87

hypothesis: low state of γ -ray emission traces π^0 decay in ICM:

- X-ray data \rightarrow *n* and *T* profiles
- assume steady-state CR streaming: $P_{\rm cr} \propto \rho^{\gamma_{\rm cr}/2} \propto P_{\rm th}$
- $F_{\gamma} \propto \int dV P_{cr} n$ enables to estimate $X_{cr} = P_{cr}/P_{th} = 0.31$ (allowing for Coulomb cooling with $\tau_{Coul} = 40$ Myr)

Rieger & Aharonian (2012)

 \rightarrow in agreement with non-thermal pressure constraints from dynamical potential estimates $_{(Churazov+\ 2010)}$

Cosmic-ray heating vs. radiative cooling (1)

CR Alfvén-wave heating:

$$\mathcal{H}_{cr} = -\boldsymbol{v}_{\mathcal{A}} \cdot \boldsymbol{\nabla} \boldsymbol{P}_{cr} = -\boldsymbol{v}_{\mathcal{A}} \left(\boldsymbol{X}_{cr} \nabla_r \langle \boldsymbol{P}_{th} \rangle_{\Omega} + \frac{\delta \boldsymbol{P}_{cr}}{\delta I} \right)$$

- Alfvén velocity v_A = B/√4πρ with B ~ B_{eq} from LOFAR and ρ from X-ray data
- X_{cr} inferred from γ rays
- P_{th} from X-ray data
- pressure fluctuations $\delta P_{\rm cr}/\delta I$ (e.g., due to weak shocks of $\mathcal{M}\simeq$ 1.1)

Cosmic-ray heating vs. radiative cooling (1)

CR Alfvén-wave heating:

$$\mathcal{H}_{cr} = -\boldsymbol{v}_{\mathcal{A}} \cdot \boldsymbol{\nabla} \boldsymbol{P}_{cr} = -\boldsymbol{v}_{\mathcal{A}} \left(\boldsymbol{X}_{cr} \nabla_r \langle \boldsymbol{P}_{th} \rangle_{\Omega} + \frac{\delta \boldsymbol{P}_{cr}}{\delta l} \right)$$

- Alfvén velocity v_A = B/√4πρ with B ~ B_{eq} from LOFAR and ρ from X-ray data
- X_{cr} inferred from γ rays
- P_{th} from X-ray data
- pressure fluctuations $\delta P_{\rm cr}/\delta I$ (e.g., due to weak shocks of $\mathcal{M}\simeq$ 1.1)

radiative cooling:

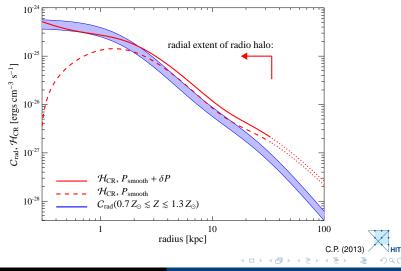

$$\mathcal{C}_{rad} = n_e n_i \Lambda_{cool}(T, Z)$$

 cooling function Λ_{cool} with Z ≃ Z_☉, all quantities determined from X-ray data

Observations of M87 Cosmic-ray heating Conclusions

Cosmic-ray heating vs. radiative cooling (2) Global thermal equilibrium on all scales in M87

Observations of M87 Cosmic-ray heating Conclusions

Cosmic-ray heating vs. radiative cooling (3)

is this global thermal equilibrium a coincidence in Virgo?

Cosmic-ray heating Conclusions

Cosmic-ray heating vs. radiative cooling (3)

is this global thermal equilibrium a coincidence in Virgo?

- CCs typically show a steep central density profile: $n \propto r^{-1}$
- central temperature profile rises slowly: $T \propto r^{\alpha}$, with $\alpha \lesssim 0.3$
- assume $v_A = \text{const.}$ and steady-state CR streaming, $P_{\text{cr}} \propto \rho^{\gamma_{\text{cr}}/2} \propto P_{\text{th}}$ (also required for self-consistency):

$$\begin{array}{ll} \mathcal{H}_{\rm cr} & \propto & \displaystyle \frac{\partial}{\partial r} P_{\rm th} \propto \frac{\partial}{\partial r} r^{\alpha-1} \propto r^{\alpha-2} \\ \mathcal{C}_{\rm rad} & \propto & \displaystyle n^2 \propto r^{-2} \end{array}$$

Cosmic-ray heating vs. radiative cooling (3)

is this global thermal equilibrium a coincidence in Virgo?

- CCs typically show a steep central density profile: $n \propto r^{-1}$
- central temperature profile rises slowly: $T \propto r^{\alpha}$, with $\alpha \lesssim 0.3$
- assume $v_A = \text{const.}$ and steady-state CR streaming, $P_{\text{cr}} \propto \rho^{\gamma_{\text{cr}}/2} \propto P_{\text{th}}$ (also required for self-consistency):

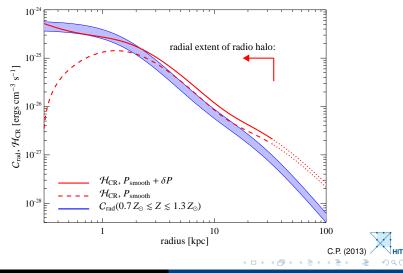

$$\begin{array}{ll} \mathcal{H}_{\rm cr} & \propto & \displaystyle \frac{\partial}{\partial r} \mathcal{P}_{\rm th} \propto \frac{\partial}{\partial r} r^{\alpha-1} \propto r^{\alpha-2} \\ \mathcal{C}_{\rm rad} & \propto & \displaystyle n^2 \propto r^{-2} \end{array}$$

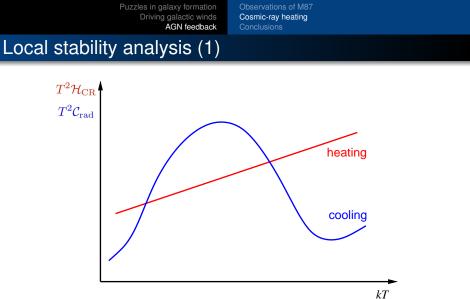

(1) identical radial profiles expected for $T \simeq \text{const.} (\alpha \simeq 0)$ (2) for a smoothly rising temperature profile, heating is slightly favored over cooling at larger radii \rightarrow onset of cooling is smoothly modulated from the outside in

프 🖌 🛪 프 🕨

Observations of M87 Cosmic-ray heating Conclusions

Additional slides

Self-consistent CR pressure in steady state

CR streaming transfers energy per unit volume to the gas as

$$\Delta arepsilon_{\mathsf{th}} = - au_{\mathsf{A}} oldsymbol{v}_{\mathsf{A}} oldsymbol{\cdot} oldsymbol{
abla}_{\mathsf{cr}} pprox oldsymbol{P}_{\mathsf{cr}} pprox oldsymbol{P}_{\mathsf{cr}} = X_{\mathsf{cr}} oldsymbol{P}_{\mathsf{th}},$$

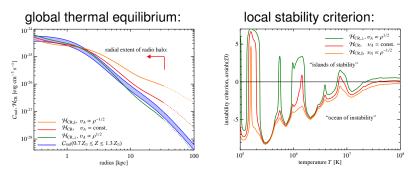

where $\tau_A = \delta I / v_A$ is the Alfvén crossing time and δI the CR pressure gradient length

 comparing the first and last term suggests that a constant CR-to-thermal pressure ratio X_{cr} is a necessary condition if CR streaming is the dominant heating process

 \rightarrow thermal pressure profile adjusts to that of the streaming CRs!

(4) (3) (4) (4) (4)

parametrize $B \propto \rho^{\alpha_B}$, which implies $v_A = B/\sqrt{4\pi\rho} \propto \rho^{\alpha_B-1/2}$:

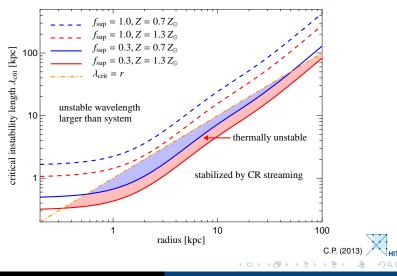

- $\alpha_B = 0.5$ is the geometric mean, implying $v_A = \text{const.}$
- $\alpha_B = 0$ for collapse along **B**, implying $v_{A,\parallel} \propto \rho^{-1/2}$

• $\alpha_B = 1$ for collapse perpendicular to **B**, implying $v_{A,\perp} \propto \rho^{1/2}$
